

Version 2.7

Traffic Generator for IP Networks (IPv4 & IPv6) FTTx, LAN, MAN, WAN, WLAN, WWAN, Mobile, Satellite, PLC, etc.

The screenshot displays the LanTraffic V2 software interface. The main window has a menu bar (File, Edit, Configuration, File Downloading, Automation Tool, Help) and a tabbed interface with four tabs: Sender - Parameters, Sender - Traffic + Statistics, Receiver - Traffic + Statistics, and Throughput Graphics. The 'Sender - Parameters' tab is active, showing a table of 16 connections. Each connection is configured with 'NO_ADDRESS' as the destination, 'TCP' as the protocol, and '2009' as the port. To the right of the table is a 'Save the Received Data' section with a 'Filename' field and 16 'Browse' buttons. Further right is a 'Traffic Generator' section with 16 rows, each containing a 'Generator' label, a 'Parameters' field, and an 'On' button. A bracket on the right side of these buttons is labeled '[P]'. At the bottom of the window, there are two sections for statistics: 'Sender Statistics (based on application data)' and 'Receiver Statistics (based on application data)'. Each section includes fields for 'Active Connections', 'Total Sending Throughput', and 'Total Receiving Throughput'. Between these sections are 'Start Receiver' and 'Stop Receiver' buttons.

Connection	IP Address or Host Name	Protocol	Port
Connection #01	NO_ADDRESS	TCP	2009
Connection #02	NO_ADDRESS	TCP	2009
Connection #03	NO_ADDRESS	TCP	2009
Connection #04	NO_ADDRESS	TCP	2009
Connection #05	NO_ADDRESS	TCP	2009
Connection #06	NO_ADDRESS	TCP	2009
Connection #07	NO_ADDRESS	TCP	2009
Connection #08	NO_ADDRESS	TCP	2009
Connection #09	NO_ADDRESS	TCP	2009
Connection #10	NO_ADDRESS	TCP	2009
Connection #11	NO_ADDRESS	TCP	2009
Connection #12	NO_ADDRESS	TCP	2009
Connection #13	NO_ADDRESS	TCP	2009
Connection #14	NO_ADDRESS	TCP	2009
Connection #15	NO_ADDRESS	TCP	2009
Connection #16	NO_ADDRESS	TCP	2009

Copyrights

Copyright ZTI 1997-2010. All rights reserved.
France Telecom licensed product.

The software described in this manual is protected by a License Agreement and may only be used in accordance with the terms of this agreement.

No part of this manual may be copied, reproduced, translated or recorded by any mean without prior written consent from ZTI.

All products and company names mentioned in this document are trademarks or registered trademarks of their respective owners.

Software License Agreement

This is an agreement between you (legal entity or physical person) and ZTI.

- **COPYRIGHT**

The enclosed Software and documentation (here after called the Products) remains the property of ZTI. French copyright laws and international treaties protect the products. ZTI grants you the right to use the products according to the following:

- **USE OF THE SOFTWARE**

You may:

- Install the software on the hard disk of your system accordingly with the software protection described in the next paragraph.
- Make one backup copy of the software, provided that this copy is not used or install on any computer.
- Use the product properly and on the following platforms only: Windows Vista, Windows Server 2003, Windows XP Home or Professional, Windows Server 2008 or Windows Seven (Business or Enterprise).

In accordance with copyrights and patent laws, the Licensee undertakes:

- To use the Products only for its own use
- Not to modify the Products
- Not to make illegal copy of the Products
- Not to give, rent, sublicense or sale the Products
- To protect and respect ZTI and Products reputation.

- **SOFTWARE PROTECTION**

LanTraffic V2 with its add-ons is licensed on a workstation basis. You will need to purchase a separate license for each machine that you install it on. Each licensed copy of the software installed on a workstation has:

- a unique Site Code that requires the corresponding unique Site Key to be entered (32-bit platforms)
- or a unique USB Software Protection Key to be plugged

to run the software.

- **LIMITED WARRANTY**

The software is supplied without any express or implied warranty regarding the performances or results obtained by the use of the Products.

ZTI warrants that the software media (i.e. CD-ROM) will be free of material defects for a ninety (90) days period following purchase. The limited warranty applies to the media and not the information contained on it. If the media does not comply with this limited warranty, the only remedy is the replacement of the media software. In no event, ZTI will be liable for any kind of direct or indirect damages caused by the Products.

- **COURT OF LAW**

French laws will govern this agreement. The court of SAINT-BRIEUC (France) shall finally settle all disputes arising out of or in connection with this Agreement.

For further information, please contact: ZTI customer support department.

Part 0 Preface

0.1 Organization of this guide

This user guide is made to helping you to discover and use **LanTraffic V2**. It is organized as follows:

- **Part 1: Product Overview**

This part briefly describes the key features of the **LanTraffic V2** and **Automation Tool for LanTraffic V2**.

- **Part 2: What's new in LanTraffic V2 version 2.7**

Is a general overview of new features, main improvements provided with **LanTraffic V2** version 2.7.

- **Part 3: Install LanTraffic V2**

Presents the product requirements, how to install the software downloaded from the Internet or from the CD-ROM, provides important information to upgrade from previous versions and explains how to choose the most suitable **LanTraffic V2** package.

- **Part 4: How to handle your license?**

Describes how to proceed for the license transfer

- **Part 5: Uninstall LanTraffic V2**

Explains how to uninstall the software.

- **Part 6: LanTraffic V2 Getting Started**

New users can use this help as an introduction to **LanTraffic V2** and generate or receive traffic with the IPv4 protocol in a few clicks.

- **Part 7: Run LanTraffic V2**

Details how to run the software and configure the license if needed.

- **Part 8: LanTraffic V2 / Windows Firewall**

Gives details about the way to configure the Windows firewall to authorize the use of **LanTraffic V2**.

- **Part 9: Graphical User Interface**

This part describes the main rules and principles of representation used by **LanTraffic V2** Graphical User Interface.

- **Part 10: Using LanTraffic V2**

How to use **LanTraffic V2**. This part includes menu and functionalities description. It is based on Windows and Tabs description. Each tab is presented separately.

- **Part 11: Command Line Parameters**

How to use a command line with parameters to start **LanTraffic V2**.

- **Part 12: How To Do ...**

Gives some examples about how and where to use **LanTraffic V2**.

- **Part 13: Source/Local IP Address and Interface requirements**

Explains in which cases, the interface selection is mandatory.

- **Part 14: Appendix**

Provides additional information about the mathematical laws used by **LanTraffic V2**, **LanTraffic V2** traces, configuration parameters saved in the Registry database, the default values of a new context and a synthesis showing the availabilities of **LanTraffic V2** features regarding the OS, protocols and IP versions.

In this document, you will find the following symbols. They mean:

Warning

Zoom or Advice

Note or Remark

0.2 Minimum System Requirements

To appropriately operate **LanTraffic V2** you need the following minimum system requirements:

- Windows XP, Windows Server 2003 or Server 2008, Windows Vista or Seven
- Pentium processor with 512 MB memory
- 1024 x 768 display and DPI setting = Normal size (96 DPI)
- 15 MB free hard disk space

Windows XP and later is required to use IPv6.

*Acrobat Reader is needed to display the **LanTraffic V2** Help. If Acrobat reader hasn't been installed, a warning message is displayed to inform that **LanTraffic V2** is available without the help file.*

0.4 Terms used in this document

Interface	Generic term used to reference a NIC (LAN adapter), a connected RAS connection (ISDN, ADSL, Modem) or a tunneling path.
Tooltip	A tooltip is a popup window displayed when you move the mouse over a sensitive area. LanTraffic V2 displays the tooltip during 5 seconds.
Automation	Automation is an add-on scripting tool used to pilot automatically LanTraffic V2 .

0.5 Technical Support

ZTI Technical Support can assist you with all your technical problems from installation to troubleshooting.

Before contacting our Technical Support, please read the relevant sections of the product documentation and the “Read Me First” file.

Before contacting our technical support, make sure you record the following information:

- Product name and version.
- Demo version or licensed product.
- System configuration.
- Problem details: settings, error messages...
- If the problem is persistent, give the details of how to create the problem.

You can contact Technical Support by:

Email: Send as many details as possible to support@zti-telecom.com or support@zti.fr

Fax: Send as many details as possible to +33 2 9648 1485

Telephone: support is available from 09:00 am to 06:00 pm (GMT Time +1 or +2), from Monday to Friday. Call +33 2 9648 4343

Part 1 Overview

1.1 LanTraffic V2 Key Features

The **LanTraffic V2** software generates traffic for IP networks by using the following protocols: TCP (Transmission Control Protocol), UDP (User Datagram Protocol), ICMP (Internet Control Message Protocol) or SCTP (Stream Control Transmission Protocol).

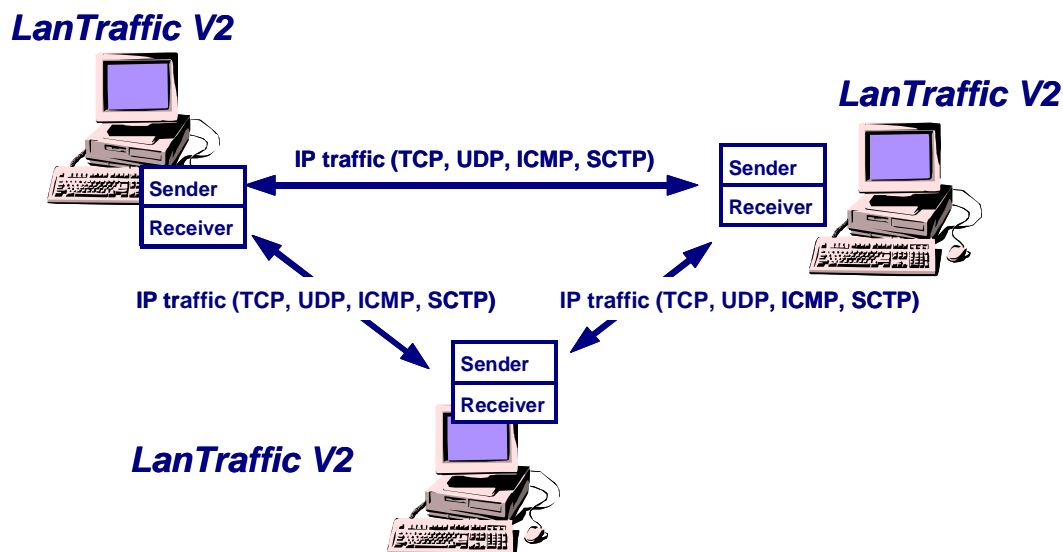

LanTraffic V2 is supported on the following platforms: Windows XP, Windows Server 2003 or Server 2008, Windows Vista or Seven. It needs at least one Ethernet connection (LAN or WLAN card i.e. NIC, remote access...).

The minimum screen resolution is 1024 x 768 and the DPI setting should be "Normal size (96 DPI)".

LanTraffic V2 requires Acrobat Reader to display the software's Help file.

The add-on software called **Automation Tool for LanTraffic V2** allows automating operations with **LanTraffic V2**. For instance, you can run test campaigns automatically.

Various testing configurations can be implemented using more than two PCs. **LanTraffic V2** creates TCP or UDP (Unicast, Multicast or Broadcast) connections between PCs through the IP network. **LanTraffic V2** creates also SCTP and ICMP connections.

The **LanTraffic V2** testing tool is made of a **Sender** part and a **Receiver** part.

- The **Sender** generates up to 16 simultaneous UDP (Unicast, Multicast or Broadcast) and/or TCP connections and/or SCTP connections and/or ICMP connections. The connections can be established in two different testing modes:

Unitary Mode: you can select the traffic generator data source and configure packets size and inter packet delay for each connection. With the ICMP protocol you can:

- ⇒ ICMP Echo request packet number and content: packet generator (fixed, randomized, alternated and increasing / decreasing).
- ⇒ ICMP Echo Request data size: fixed, randomized, alternated and increasing / decreasing.
- ⇒ ICMP Echo Reply receiving timeout: fixed, randomized, alternated, increasing / decreasing or use of a mathematical law.

LanTraffic V2 offers three different data sources:

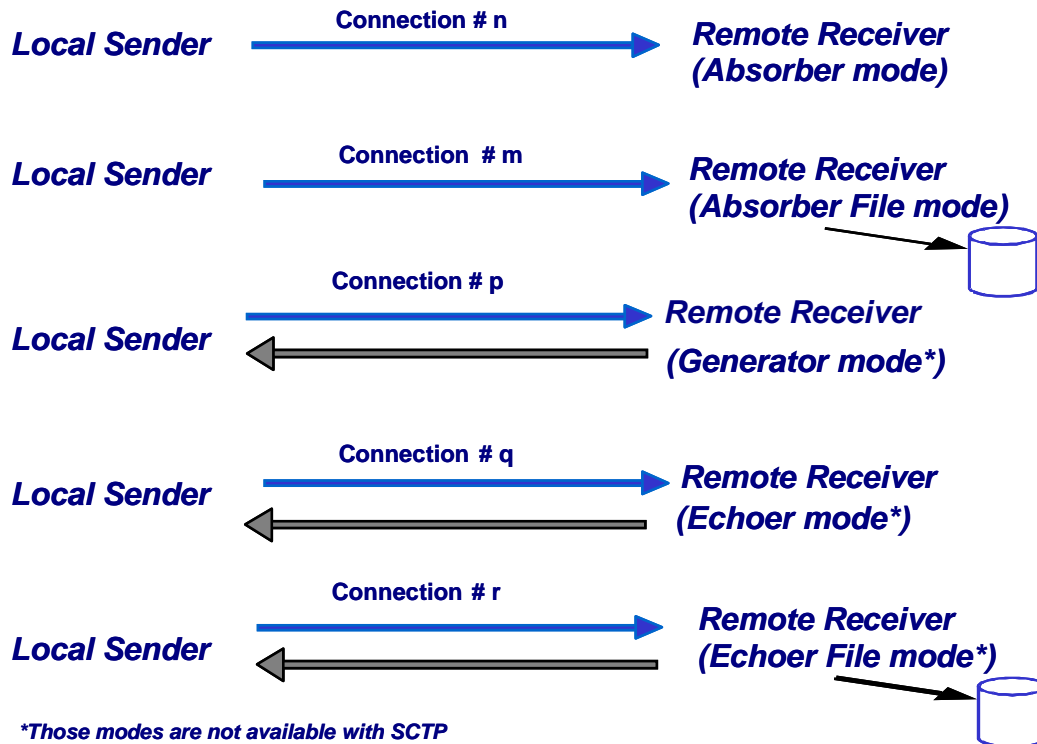

- Automatic data generator by using mathematical laws,
 - Packets generator: many parameters can be defined (number of packets to send, inter packet delay, packet contents, ...)
 - File: selection of a file to send.
- ⇒ **Automatic Mode:** select one mathematical law for connections generating (up to 16 connections) and starting time, and then select a second mathematical law for data volume to be sent. This mode is available with UDP and TCP only. With this mode, SCTP and ICMP connections can not be started.
- ⇒ **Statistics:** for each connection the following statistics parameters are displayed by the **Sender** and can be saved in a file:
- Sent throughput⁽²⁾
 - Received throughput^{(1) (2)}
 - Sent packet throughput⁽²⁾
 - Received packet throughput^{(1) (2)}
 - Sent data volume⁽²⁾
 - Received data volume (volume of data sent by the remote)^{(1) (2)}
 - Sent packets

- Received packets (packets sent by the remote) ⁽¹⁾
- Data volume to send ⁽²⁾
- Remaining volume (of data to send) ⁽²⁾
- Sequence numbering errors ⁽¹⁾
- RTT Mean (Round Trip Time) ⁽¹⁾
- Jitter ^{(1) (2)}

⁽¹⁾ These statistics are not available with SCTP protocol.

⁽²⁾ These statistics are not available with ICMP protocol.

- The **Receiver** receives traffic (up to 16 simultaneous connections) and operates five different working modes: Absorber, Absorber File, Generator, Echoer and Echoer File. With SCTP protocol, only the Absorber and Absorber File working modes are available. SCTP can not be used on both Sender and Receiver parts at the same time.
- Each Receiver connection can be set up according to one of the following five modes:

Note: We consider that the local machine is used for sending traffic and the remote one is used for receiving traffic.

⇒ **Statistics:** for each connection the following statistics parameters are displayed by the **Receiver** part and can be saved in a file:

- Sent throughput⁽¹⁾
- Received throughput
- Sent packet throughput⁽¹⁾
- Received packet throughput
- Sent data volume⁽¹⁾
- Received data volume (volume of data sent by the remote)
- Sent packets⁽¹⁾
- Received packets (packets sent by the remote)
- Data volume to send⁽¹⁾
- Remaining volume (of data to send) ⁽¹⁾
- Sequence numbering errors
- Data not echoed⁽¹⁾
- Jitter

⁽¹⁾ These statistics are not available with SCTP protocol.

Multicast feature

LanTraffic V2 is able to generate and receive Multicast IP traffic (IPv4 and IPv6). The multicast feature is used for the UDP protocol only.

- **Multicast & IPV4:** IPv4 addresses from 224.0.0.0 to 239.255.255.255 are MULTICAST IP addresses. These addresses can be used to generate multicast IP traffic (define the multicast IP address in the Sender part) or to receive multicast IP traffic (define the multicast IP address in the Receiver part).
- **Multicast & IPv6:** IPv6 multicast addresses are defined in "IP Version 6 Addressing Architecture" [RFC2373].
 This defines fixed and variable scope multicast addresses. IPv6 multicast addresses are distinguished from unicast addresses by the value of the high-order octet of the addresses: a value of 0xFF (binary 11111111) identifies an address as a multicast address; any other value identifies an address as a unicast address (FE80::/10 are Link local addresses, FEC0::/10 are Site Local addresses where FF00::/8 are Multicast addresses).
Multicast addresses from FF01:: through FF0F:: are reserved.
The complete list of Reserved IPv6 multicast addresses can be found in "IPv6 Multicast Address Assignments" [RFC 2375].
The ICMPv6 messages are used to convey IPv6 Multicast addresses resolution.

Broadcast feature (available with IPv4 only)

LanTraffic V2 is able to generate and receive Broadcast IP traffic (IPv4 only). The broadcast feature is used for the UDP protocol only.

- **Broadcast & IPV4:** IPv4 addresses as 255.255.255.255 or 192.168.0.255 are BROADCAST IP addresses. These addresses can be used to generate broadcast IP traffic (define the broadcast IP address in the Sender part). To receive broadcast IP traffic, specify the unicast IP address of the Sender in the Receiver part.
- **Broadcast & IPv6:** broadcast does not apply to IPv6.

IP version selection (Windows XP and later)

Please note that **LanTraffic V2** supports IPv6 from Windows XP and later versions (Server 2003, Server 2008, Seven or Vista). On Windows XP, IPv6 is not installed by default: it should be added on the network interface you want to use.

LanTraffic V2 supports the IPv6 numerical address format (128 bits long) as well as canonical addresses. The IPv6 multicast is available with **LanTraffic V2** in accordance to RFC 2373 where a multicast IPv6 address starts with FF.

With IPv6 the maximum size of the packet to avoid fragmentation is **1440** bytes whereas it is 1460 bytes in TCP with IPv4.

Interface selection

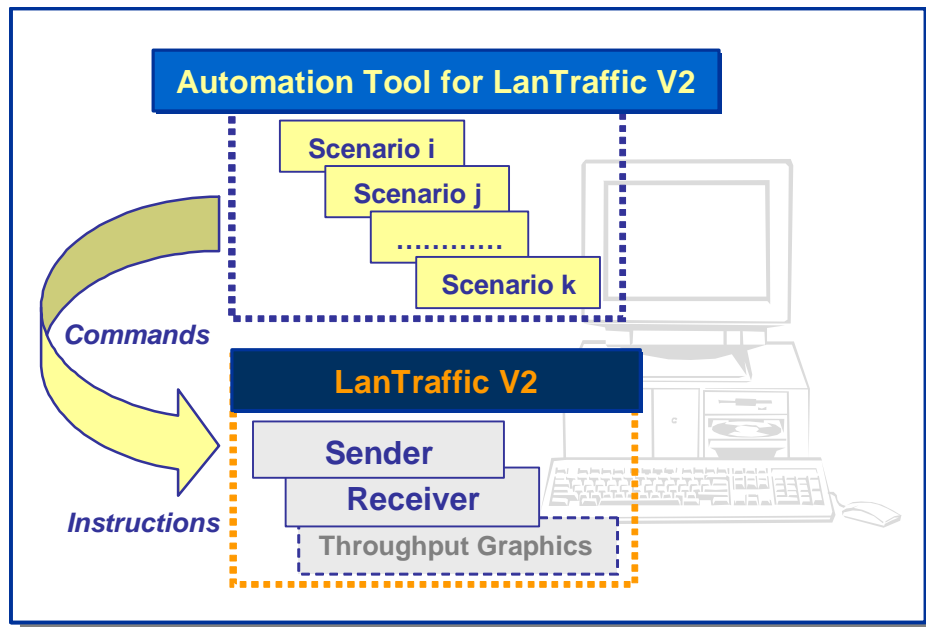

The interface selection of a LAN card (NIC), a virtual NIC such as an IP tunneling protocol or a remote access is useful to control the data traffic hardware route. **LanTraffic V2** is able to generate and receive Unicast and Multicast IP traffic on a selected interface, giving the user a deeper control where data are exchanged and makes multiple routes definition easier. The interface selection is not available with SCTP.

Statistics values

Statistics values presented by **LanTraffic V2** are calculated at the Application level. They don't include the protocol header, the IP header nor data link header and/or trailer.

1.2 The Automation Tool for LanTraffic V2

The add-on software **Automation Tool for LanTraffic V2** allows you to edit scenarios, to carry out scenarios, to set the **LanTraffic V2** parameters and to pilot **LanTraffic V2** automatically on the same PC.

A scenario is a succession of **commands** and **instructions**.

A **command** is used to set parameters and/or activate a function of **LanTraffic V2**. For example the **Set and Start connection(s)** command helps to set parameters for IP connections and to start the traffic on these connections. With such command you specify the IP address, port number, protocol, packet size, inter packet delay, duration, etc. and you start the traffic generation for these connections.

An **instruction** is used by the Automation Tool to create an internal process. For example, the **Wait Date/Time** instruction suspends the scenario execution up to the specified date and time before to continue.

By using the **Automation Tool for LanTraffic V2** you can:

- Set automatically the parameters of the **LanTraffic V2** software,
- Start and stop IP connections based on timers,
- Execute the scheduled operations in accordance with your own timing,
- Make repetitive tests operations automatically,
- Simplify the tests reproduction,
- And more...

Part 2 What's new in LanTraffic V2 Version 2.7

This part is a general overview of new features and main improvements of **LanTraffic V2** version 2.7.

Details regarding features and corrections included in the different versions of **LanTraffic V2** can be found in the version.txt file located in the installation directory (by default: C:\Program Files\LanTraffic V2). To upgrade your software from previous versions, please refer to paragraph 3.1.

⇒ **LanTraffic V2 (Version 2.7)**

- Supports Windows XP, Vista, Seven, Server 2003 and Server 2008
- Tested on of 32-bit and 64-bit Windows edition

The contexts created with versions 2.0.12 and higher are reused automatically. When saved, they become the new 2.7 context file format.

⇒ **Automation Tool for LanTraffic V2 (Version 1.7)**

- Supports Windows XP, Vista, Seven, Server 2003 and Server 2008
- Various corrections
-

The scenarios created with older versions are reused automatically. When saved, they become the new 1.7 scenario file format.

Part 3 Install LanTraffic V2

LanTraffic V2 requires less than 15 MB of free disk-space. The default settings folder is C:\Program files\LanTraffic V2. The "**Automation Tool for LanTraffic V2**" add-on software is automatically installed with **LanTraffic V2**.

** To run **LanTraffic V2** your computer screen resolution must be at least 1024 X 768 and the DPI setting should be set up with the "Normal size (96 DPI)" value.*

** To install **LanTraffic V2**, you must log on with the administrator rights.*

*We recommend that you shutdown first your anti-virus application before installing **LanTraffic V2**. Please note that you should mask the task bar in a 1024x768 screen resolution, so you get an optimal view of the software interface.*

The installation procedure is a standard installation program for Windows XP, Windows Server 2003, Windows Server 2008, Windows Seven and Windows Vista.

3.1 Forewords when upgrading from previous versions

There is no need to uninstall earlier version of **LanTraffic V2** before upgrading to version 2.7. Starting by **LanTraffic V2** version 2.7 has introduced a new protection using the USB Software Protection Key. But previous users of **LanTraffic V2** can continue using their Site Key license. **When upgrading from a previous version of LanTraffic V2, do not uninstall the previous version to keep your existing license.**

3.2 How to install the software downloaded from the Internet

*To install **LanTraffic V2**, you must log on with the administrator rights.*

If you have downloaded **LanTraffic V2** trial version from our website, you have downloaded the "LanTrafficV2.zip" file including the software and the related documentation. You must first unzip this file in a temporary directory. Then run [Setup_LanTrafficV2_Standard.exe](#) from this temporary directory to launch the setup procedure.

3.3 How to install the software from the CD-ROM

The installation procedure is a standard installation program.

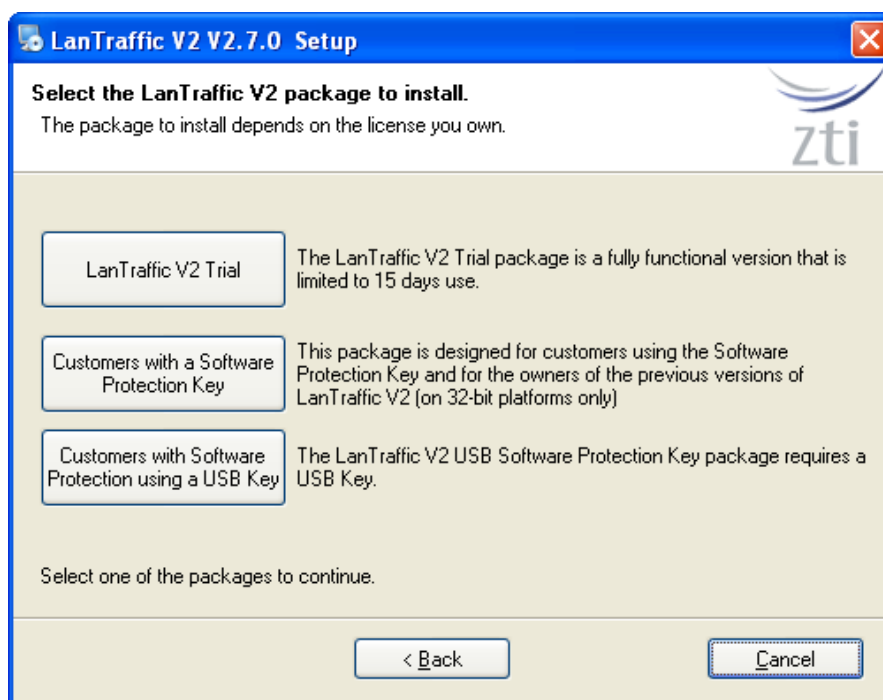

*To install **LanTraffic V2**, you must log on with your administrator rights.*

- First, insert the **LanTraffic V2** CD-ROM in your CD-ROM drive.
- Click on [Setup_LanTrafficV2_Standard.exe](#).
Follow the **LanTraffic V2** setup instructions to proceed with the installation.

3.4 During the installation

Follow the instructions until reaching the **LanTraffic V2** package selection window.

3.4.1 LanTraffic V2 packages in a few words

To use the **LanTraffic V2** software, there are 3 license schemes:

- The **LanTraffic V2 Trial package** allows you to use **LanTraffic V2** during 15 days after the first run. When the trial period has expired, the license should be purchased.
- The **LanTraffic V2 Software Protection Key package** has been designed for users owning a Software License key and for the users of the previous versions of **LanTraffic V2**. It keeps your current installation and files, without additional requirement.
- For new users, the **LanTraffic V2 USB Software Protection Key package** requires a USB key with the **LanTraffic V2** license. The **USB key** is provided with **LanTraffic V2** from version 2.6. This package allows the installation of **LanTraffic V2** on several PCs but the only PC able to run **LanTraffic V2** is the one having the USB key plugged in.

As previous users, you may be interested to move to a USB Software Protection Key: please contact your distributor or ZTI to get more details about the license migration program (see 4.3 LanTraffic V2 & USB Software Protection Key for more details).

This software is licensed on a per workstation basis. This means that you will need to get a separate license for each machine you will run it on. The license may be a software key (for previous users) or the USB key. Each licensed copy of the software gets a USB Software Protection key that can be moved from one installation to the other.

The USB key contains only the license information. The software is available on a separate CD-ROM.

3.4.2 Which package should I install?

Depending on your needs, please find here below the package most suitable for you.

3.4.2.1 I want to evaluate **LanTraffic V2**

In that case, choose the *“IP Traffic – Test & Measure Trial”* package. You will be able to use **LanTraffic V2** during 15 days only.

3.4.2.2 I already use **LanTraffic V2** ...

This paragraph is dedicated to the users owning a previous version of **LanTraffic V2**.

3.4.2.2.1 ... and I want to upgrade and keep my permanent license

In that case, choose the *“Customers with a Software Protection Key”* package. Your installation will be upgraded and your existing permanent Software Protection Key will be kept.

3.4.2.2.2 ... and I want to upgrade and use the USB Software Protection Key I bought

In that case, choose the package *“Customers with Software Protection using a USB Key”*. Plug the USB Software Protection Key before launching **LanTraffic V2**.

3.4.2.3 I just bought **LanTraffic V2** ...

This paragraph is related to the users purchasing **LanTraffic V2 version 2.7**.

3.4.2.3.1 ... and I chose the Electronic Software Delivery (ESD)

In that case, choose the package *“Customers with a Software Protection Key”*. When you launch the software for the first time, press the “Enter” key when the ZTI logo appears. Then, get the site code and mail it to us with your details and your purchase order reference at contact@zti-telecom.com. We will send you back the site key enabling your permanent Software Protection Key. More details about the way to proceed are available in paragraph *“4.2.1 Installation of the Software Protection Key”*.

3.4.2.3.2 ... and I received the CDROM & USB Software Protection Key

In that case, choose the package *“Customers with Software Protection using a USB Key”*. Plug the USB Software Protection Key before running **LanTraffic V2**.

3.4.2.3.3 ... and I will receive the CDROM & USB Software Protection Key in a few days

In that case, choose the package *“Customers with a Software Protection Key”*. You will get a fully functional but time-limited Software Protection Key.

3.5 What has been installed on my computer?

The default settings install **LanTraffic V2** in the following directory: C:\Program Files\LanTraffic V2.

The **LanTraffic V2** installation procedure installs the main following files on your hard disk:

- LanTrafficV2.exe: program file
- LanTraffic V2 User Guide: PDF file.
- Read Me First: PDF file
- Aut_LTV2.exe: program file (Automation tool)
- Automation Tool for LanTraffic V2 User Guide: PDF file
- Automation scenario samples and other files required by the software
- Viewer.exe: program file installed with the USB Software Protection package
- ElevateLanTrafficV2.exe: allows running LanTrafficV2 as administrator (for Windows Vista and later)
- Version.txt: text file containing information about the versions.

Start Menu shortcuts created:

Start > Programs > **LanTraffic V2**

- ⇒ **Automation Tool for LanTrafficV2** (click to run the software)
- ⇒ **Automation Tool for LanTrafficV2 User Guide** (PDF file)
- ⇒ **LanTraffic V2** (click to run the software)
- ⇒ **LanTraffic V2 (Run as administrator)** (on Windows Vista and later)
- ⇒ **LanTrafficV2 User Guide** (PDF file)
- ⇒ **Read Me First** (PDF file)

*If the RPC mechanism is disabled, a message will ask automatically for the system reboot at the end of the installation. This is mandatory to allow the dialog between the Automation Tool and **LanTraffic V2**.*

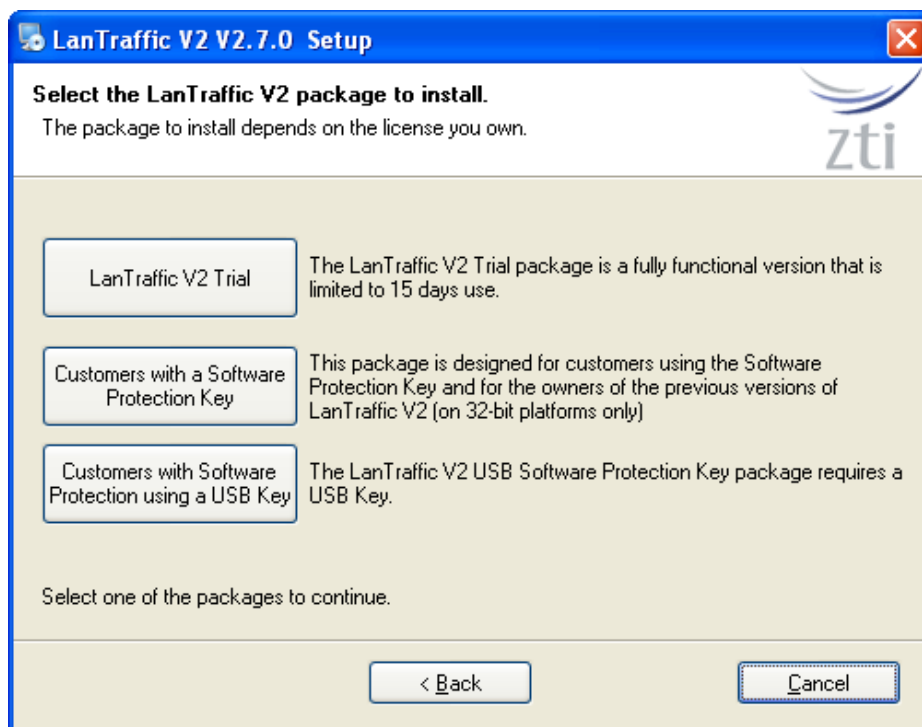

3.6 How to reinstall another package?

These steps are mandatory for users that want to install a new LanTraffic V2 package on their current LanTraffic V2 V2.7 configuration.

The users having LanTraffic V2 V2.6 or older are not concerned by the following steps. To upgrade from previous versions, refer to paragraph 3.1 “Forewords when upgrading from previous versions”

If you have already installed one of the LanTraffic V2 V2.7 packages, you should uninstall first your current package (get more details at *Part 5 Uninstall LanTraffic V2*) before installing a new one. Then click Setup_LanTrafficV2.exe and select, in the window below, the new package you want to install.

3.7 How to transfer the software to another computer?

Install the software on the target computer. You don't need to do any particular operation with the “*Customers with Software Protection using a USB Key*” and “*LanTraffic V2 Trial*” packages.

With **LanTraffic V2** & USB Software Protection Key, you do need to plug the USB key before running the software on the target computer.

With the package “*Customers with a Software Protection Key*”, install the software on the target computer and refer to the paragraph “4.2.2 Software License Transfers” to know how to transfer the Software Protection Key.

Part 4 How to handle your license

4.1 LanTraffic V2 Trial

You don't require any license to install the **LanTraffic V2 Trial package**. After the first run of **LanTraffic V2**, the **LanTraffic V2 Trial package** can be used during 15 days.

4.1.1 LanTraffic V2 License Information window

When you run **LanTraffic V2**, the information about your trial license is displayed, as shown below.

You are now able to use **LanTraffic V2** during the next 15 days.

4.1.2 End of the fifteen-day trial period

Once the trial period is finished, you are not allowed to use **LanTraffic V2** anymore, as shown below:

When you press the **OK** button, **LanTraffic V2** will stop running. To continue to use **LanTraffic V2** please contact your local distributor or ZTI to get a license.

4.2 LanTraffic V2 & Software Protection Key

The section 4.2.1 is relevant only for users that got the Software Protection Key.

Licensed users of **LanTraffic V2** that are already using the Software Protection Key should not need to refer to the section 4.2.1. To transfer the owned Software Protection Key to another PC or to another directory, please go directly to section 4.2.2.

4.2.1 Installation of the Software Protection Key

*This software is licensed on a per workstation basis. This means that you will need to get a separate license for each machine you will install it on. Each licensed copy of the software installed on a system has a unique **Site Code** that requires a corresponding unique **Site Key** to work. A period of 15 days is automatically enabled at the first installation of the software. If you try to install the software again, the Software Protection Key will disable the trial period.*

If you want to configure your Software Protection Key before the trial period ends, press **Enter** just after launching the **LanTraffic V2** when the following message is displayed:

Then, you will see the following Software License configuration window:

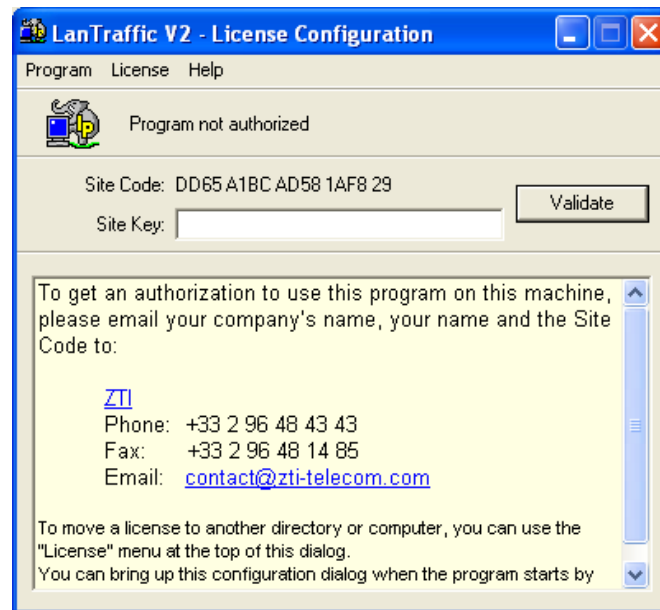

Under Windows Vista and later, you must have the administrator rights to be able to use the Software Protection Key. Launch LanTraffic V2 by clicking on “LanTraffic V2 (Run as administrator)” shortcut.

At the end of the trial period when you launch **LanTraffic V2**, the same software license configuration window appears, but saying "Program not authorized" instead of showing the remaining days of use.

To get the **Site Key** and obtain an unlimited version, please send an email to contact@zti-telecom.com or contact@zti.fr with the following information:

- The **Site Code** (you can copy and paste the Site Code displayed in the license window)
- The name of the software: **LanTraffic V2**
- The OS used
- Your details
- The purchase order's number and date of purchase

We will then email you the **Site Key**. You can now close the license's window.

After you have received the email with the **Site Key**, open the Software License configuration window again by pressing the Enter key as explained before. Copy the Site Key in and then click "Validate". After validation of the Site Key, you will get the following message:

⇒ **Important:** one **Site Code** is associated with one **Site Key**, and only one. A **Site Code** is unique for each PC installed. For security reasons, as soon as you validate a **Site Key** (trial or unlimited), the Software License program generates a new **Site Code** automatically.

- ⇒ For any question or further information, please contact our technical support:
Email: support@zti-telecom.com or support@zti.fr
Phone: +33 2 9648 4343
Fax: +33 2 9648 1485

*When you launch **LanTraffic V2** with an unlimited software License, you will see the following window:*

4.2.2 Software License Transfers

A Software License transfer is not a duplication of any type.

Please contact ZTI or your authorized distributor for site software license information and for several software licenses purchase.

Software Licenses can be transferred using one of the following methods:

- ⇒ **Direct transfer:** move the Software License to another directory of the same PC or between two PCs linked to the same network.
- ⇒ **Transfer by media:** move the Software License from a source PC to a target PC by using a floppy disk or USB key.

4.2.3 Direct Transfer: move the Software License from one local directory to another

This transfer mechanism must be used to move a Software License in two cases:

- From a source to a target directory of the same PC
 - From a source to a target directory of networked PCs
- First, copy the program (copy the **LanTraffic V2** folder) to the target directory.
For example from "C:\Program Files\LanTraffic V2" to "C:\Temp\LanTraffic V2"
 - Then run the program from its original directory (from "C:\Program Files\LanTraffic V2").
When the license configuration window appears, press **Enter** and select "License > Transfer to directory ..." in the License menu as shown below:

- Provide the path name of the target program (for example *C:\Program Files\LanTraffic V2\LanTrafficV2.exe*).
The Software License is now transferred to the new directory.

4.2.4 Transfer by Media (floppy disk or USB key) from a source PC to a target PC

A floppy disk or USB key is needed for this kind of transfer.

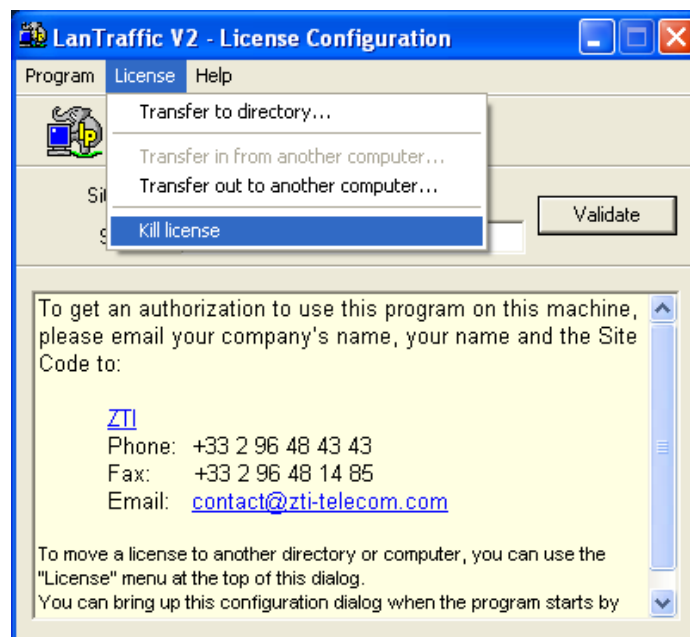

To transfer the Software License from the source PC (PC #1) to the target PC (PC #2), proceed as described in the following order:

- 1) First install the program on the target PC (PC #2).
- 2) Run the software on PC # 2 and Kill the trial Software License in order to get an unauthorized license on this PC.

If the "Transfer in from another computer ..." item of the license menu is disabled, you must kill the license.

4.2.4.1 How to kill the Software License?

When the Software License configuration window appears, press **Enter** and select "License > Kill license" in the license menu.

A message box will appear:

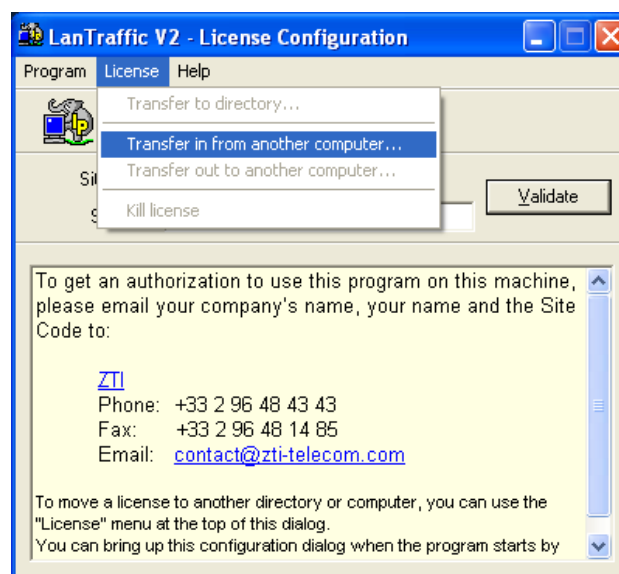

Press 'Yes' to kill the Software License and a confirmation code is displayed:

Click 'OK' and the license window displays now "Program not authorized":

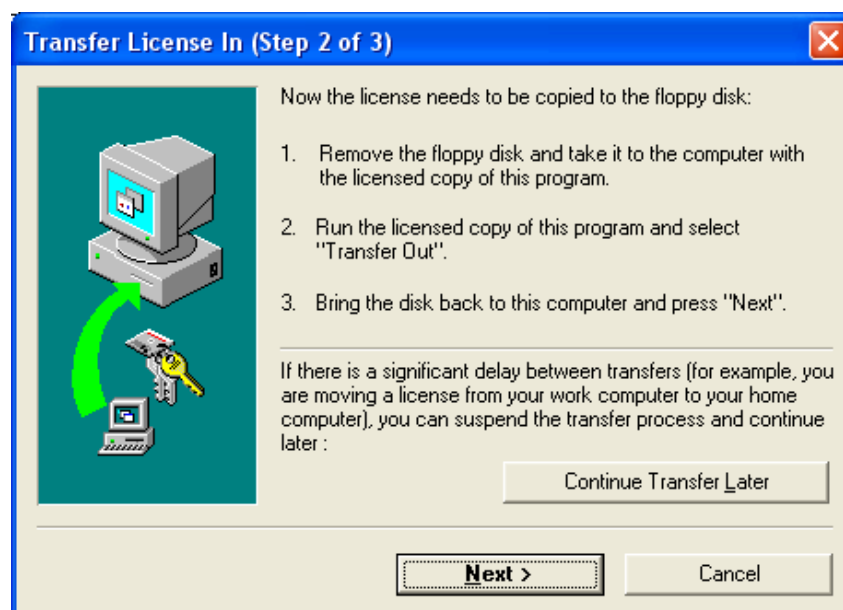

3) Select "License > Transfer in from another computer ..." from in the Software License menu:

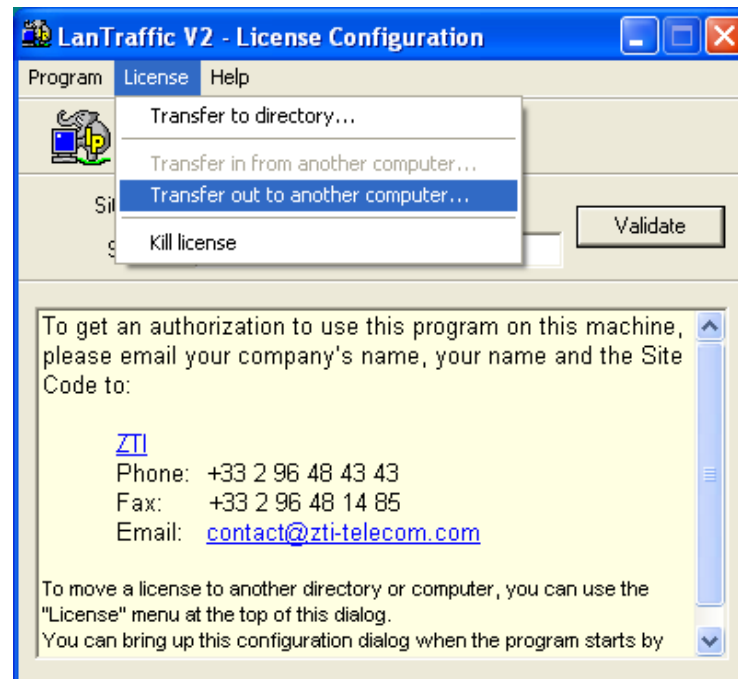

The "Transfer License In (Step 1 of 3)" window is displayed:

4) Insert a floppy disk or use a USB key as requested in step 1 of 3 and specify the path. Then press "Next >": the "Transfer License In (Step 2 of 3)" window is displayed:

5) Go to the source PC (PC #1) and insert the media (floppy disk or USB key). Then start the program on PC #1. When the license configuration window appears, press **Enter** and select "License > Transfer out to another computer ..." as shown below:

The following window is displayed:

Input the media path (floppy disk or USB key) and then press "Next >".

When the license is put on the media, you get the "Program not authorized" message:

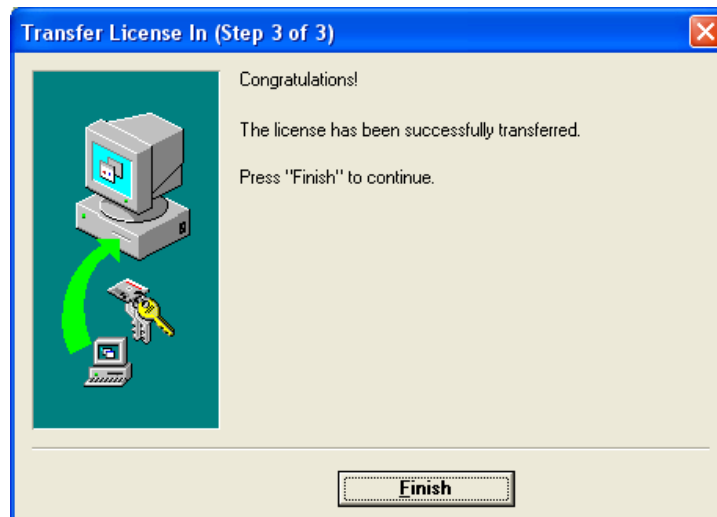

You can check that the license is not available anymore on the source PC since the **LanTraffic V2** software license is on a workstation basis. *Contact us to get information on site license (contact@zti.fr or contact@zti-telecom.com).*

6) Remove the media from PC #1 and return to PC #2.

Click the 'Next' button on the step 2 of 3 of the "Transfer license in" window (on PC #2) to complete the transfer.

The unlimited Software License key is now transferred from the source PC to the target PC, and you get the following message:

Click Finish to continue.

4.3 LanTraffic V2 & USB Software Protection Key

The USB Software Protection Key is the most flexible way to transfer your license to any other PC. Plug it in the computer you want to use **LanTraffic V2** on.

If you are a user of a previous version of **LanTraffic V2** (version 2.5 and under) change for more flexibility to a **USB Software Protection Key** by contacting the Sales Offices (sales@zti-telecom.com) and get some information about how to exchange your Site Key to a **USB Software Protection key**.

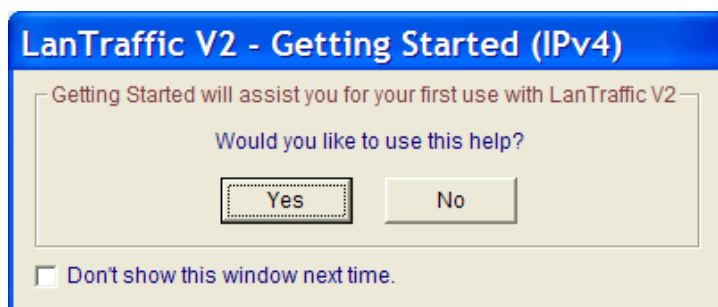

Part 5 Uninstall LanTraffic V2

The uninstall procedure is a standard uninstall program. To uninstall **LanTraffic V2** select “Uninstall LanTraffic V2” in the “Start > Programs > LanTraffic V2” menu.

Part 6 LanTraffic V2 Getting Started

 *Anti-virus or firewall applications may disrupt **LanTraffic V2** when sending or receiving data. Please set up your security software before using **LanTraffic V2** (see Part 7 and Part 8).*

New users can use this help as an introduction to **LanTraffic V2** and generate or receive TCP and UDP data with the IPv4 protocol in a few clicks. Just after launching **LanTraffic V2**, the Getting Started Window is displayed:

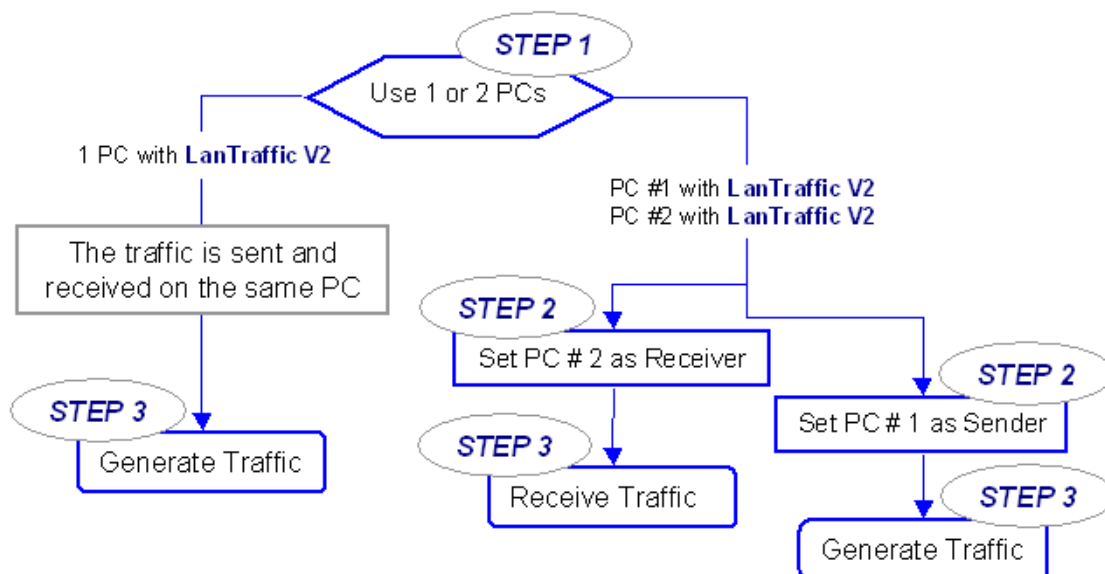

Press **No** if you don't want to use this help.

Press **Yes**, the next window will ask you if you want to use 1 or 2 PCs:

Depending on your choice to use 1 or 2 PCs, the plan below shows the steps:

For the use of 1 PC

The following window is displayed.

LanTraffic V2 - Getting Started (IPv4) - Step 3/3

In order to help you to use LanTraffic V2, this assistant is going to generate traffic using two connections. The first one will use TCP protocol and the second one will use UDP protocol.
The data are generated from the **Sender** to the **Receiver** of LanTraffic V2 on your PC.

LanTraffic V2

For this configuration, the IPv4 address and port number used are specified as follows

IPv4 Address: *

Port Number: (the value should be between 1 and 65535)**

* You can specify an IPv4 Address respecting the standard format (ex: 192.168.0.1) or use a host name (ex: myremotepc, myserver, ...).

** Set up the same port number that you have specified on the PC chosen as traffic **Receiver**.

To start the **Sender** and the **Receiver**, click on the "Generate Traffic" button.

Then press the "Generate traffic" button to continue. The "Sender – Traffic + Statistics" tab of LanTraffic V2 will display the two first active connections as shown on the following window:

LanTraffic V2

Start Sender and Receiver
Stop Sender and Receiver

For the use of 2 PCs

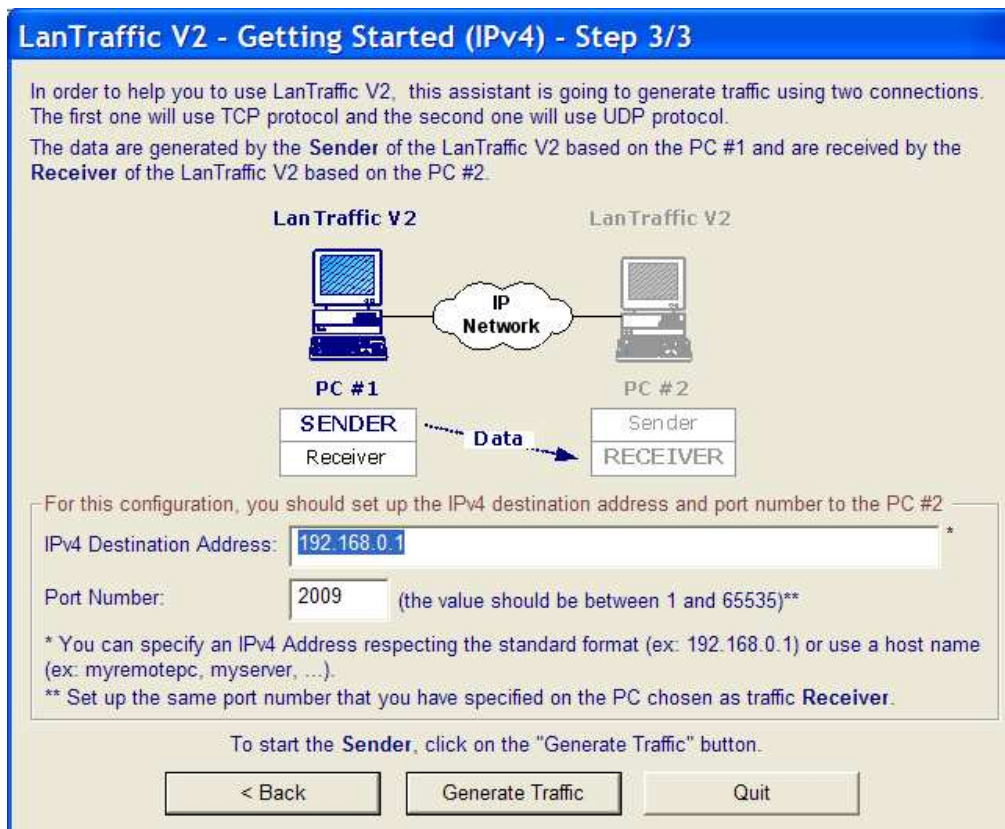

If you select the option: **I use two PCs**, read the following instructions. **LanTraffic V2** must be installed on the two PCs.

Press "Next Step >" to continue.

Then choose if you want to generate or receive the traffic on this PC. If you select "Generate traffic" the following window will appear:

Define the IPv4 address and port number to use. Then press the "Generate traffic" button and a warning dialog is displayed:

Before generating traffic towards PC # 2, the PC # 2 must be configured as Receiver.

Press "Next Step >" to continue on PC # 2.

After pressing the "Ready to Receive Traffic" button, a warning message will appear:

Press "OK" and the "Receiver – Traffic + Statistics" tab of **LanTraffic V2** is displayed on PC # 2.

Then go to PC # 1 and start the **LanTraffic V2** Sender. The "Sender – Traffic + Statistics" tab of **LanTraffic V2** displays now the two first active connections. You have now 2 connections generating traffic from PC #1 to PC # 2.

Part 7 Run LanTraffic V2

Use the Windows start menu:

Start ► All Programs ► LanTraffic V2 ►  LanTraffic V2 Click here.

Under Windows Vista and later, a new shortcut allows starting LanTraffic V2 with the administrator rights (Start > All Programs > LanTraffic V2 > LanTraffic V2 (Run as administrator)). You must have the administrator rights to be able to use the DSCP field. To get more details, please refer to the paragraph “10.4.1.3.2.4 The DSCP field (with IPv4 only)”.

Under Windows Vista and later, you must have the administrator rights to be able to run the Software Protection Key. If you installed this package, LanTraffic V2 must be started using the “LanTraffic V2 (Run as administrator)” shortcut.

After a few seconds and depending on your license, you will get one of the following license windows:

15 days trial version	Software Protection Key version
	
USB Software Protection Key version	
If you use a USB Software Protection Key, there is no window!	

The Windows Firewall may display the following window, to allow configuring the Windows Firewall settings for **LanTraffic V2**. Click on the “Allow Access” (or “Unblock” depending on the target OS) button to add **LanTraffic V2** into the authorized programs list.

Part 8 LanTraffic V2 and Windows Firewall

Anti-virus or firewall applications may disrupt **LanTraffic V2** from sending or receiving data. Please set up your security software before using **LanTraffic V2**.

Windows Firewall may also disrupt the **LanTraffic V2** performances. To get best performances, you should disable Windows Firewall.

Some anti-virus configurations can stop **LanTraffic V2** working because of their security settings. For commercial anti-virus, please refer to the related documentation to authorize **LanTraffic V2** to work.

8.1 How to authorize TCP and UDP connections with Windows XP and Windows Server 2003

The Windows Firewall on Windows XP and Windows Server 2003 blocks incoming network connections except for the authorized programs. To allow LanTraffic V2 receiving incoming TCP or UDP connections, you must add it in the exceptions list of Windows Firewall by proceeding as follows:

Step1: Open a command prompt window. You should be logged on an account giving the administrator rights to be able to modify the firewall configuration.

Step 2: type the command line below and press "Enter".

```
%> netsh firewall add allowedprogram program="C:\Program Files\LanTraffic V2\LanTrafficV2.exe"  
name="LanTraffic V2" mode=ENABLE scope=ALL profile=ALL
```

Make sure that "C:\Program Files\LanTraffic V2\" is the installation directory of LanTraffic V2. A message of confirmation is returned by *netsh* if the command is succeeded. If the path you have specified is invalid, *netsh* returns an error message close to the following message: *The system cannot find the file specified*. In that case, please renew Step 2.

Unlike under Windows Vista and later, the firewall allows the incoming echo replies and SCTP traffic. You don't need to add a rule to be able to receive ICMPv4/ICMPv6 "echo reply" messages or to send/receive SCTP data.

8.2 How to authorize UDP and TCP connections with Windows Firewall

The Windows Firewall blocks incoming and outgoing network connections except for the authorized programs. By default, all outgoing connections are allowed. But to authorize LanTraffic V2 receiving incoming connections, you must add it in the exceptions list of Windows Firewall by proceeding as follows:

Step1: Open a command prompt window with the administrator rights. The administrator rights are mandatory to set up the firewall configuration. Open the "All Programs / Accessories" folder and right-click on the "Command Prompt" icon as shown on the figure below and choose "Run as administrator". A command prompt window is opened.

Step 2: type the command line below and press "Enter".

```
%> netsh firewall add allowedprogram program="C:\Program Files\LanTraffic V2\LanTrafficV2.exe"  
name="LanTraffic V2" mode=ENABLE scope=ALL profile=ALL
```

Make sure that "C:\Program Files\LanTraffic V2\" is the installation directory of LanTraffic V2. A message of confirmation is returned by *netsh* if the command is succeeded. If the path you have specified is invalid, *netsh* returns an error message close to the following message: *The system cannot find the file specified.* In that case, please renew Step 2.

With Windows Vista and later, the firewall blocks the incoming echo replies and SCTP traffic. You must add a rule to be able to receive ICMPv4/ICMPv6 "echo reply" messages or to send/receive SCTP data. Please refer to the paragraphs here after.

8.3 How to authorize ICMPv4 and ICMPv6 traffic with Windows Firewall

The Windows Firewall blocks incoming ICMPv4 and ICMPv6 "echo reply" messages. To be able to receive these messages, you must add two new rules by proceeding as follows:

Step1: Open a command prompt window with the administrator rights. The administrator rights are mandatory to do the firewall configuration. Open the "All Programs / Accessories" folder and right-click on the "Command Prompt" icon as shown on the figure below and choose "Run as administrator". A command prompt window is opened.

Step 2: To create the rule for ICMPv4 echo reply messages, type the command line below and press "Enter".

```
%> netsh advfirewall firewall add rule name="Echo Reply ICMPv4 (used by LanTraffic V2)" dir=in  
action=allow profile=any localip=any remoteip=any protocol=icmpv4:0,0 interfacetype=any
```

A message of confirmation is returned by *netsh* if the command is succeeded.

Step 3: To create the rule for ICMPv6 echo reply messages, type the command line below and press "Enter".

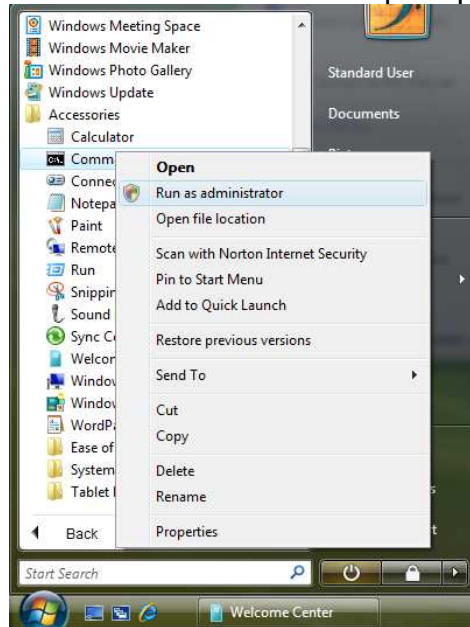

```
%> netsh advfirewall firewall add rule name="Echo Reply ICMPv6 (used by LanTraffic V2)" dir=in  
action=allow profile=any localip=any remoteip=any protocol=icmpv6:129,0 interfacetype=any
```

A message of confirmation is returned by *netsh* if the command is succeeded.

8.4 How to authorize SCTP connections with Windows Firewall

The Windows Firewall blocks incoming and outgoing SCTP traffic. To be able to send and receive SCTP data, you must add two new rules by proceeding as follows:

Step1: Open a command prompt window with the administrator rights. The administrator rights are mandatory to set up the firewall configuration. Open the "All Programs / Accessories" folder and right-click on the "Command Prompt" icon as shown on the figure below and choose "Run as administrator". A command prompt window is opened.

Step 2: To create the rule for incoming SCTP traffic, type the command line below and press "Enter".

```
%> netsh advfirewall firewall add rule name="SCTP (used by LanTraffic V2)" dir=in action=allow profile=any localip=any remoteip=any protocol=132 interface=any
```

A message of confirmation is returned by *netsh* if the command is succeeded.

Step 3: To create the rule for outgoing SCTP traffic, type the command line below and press "Enter".

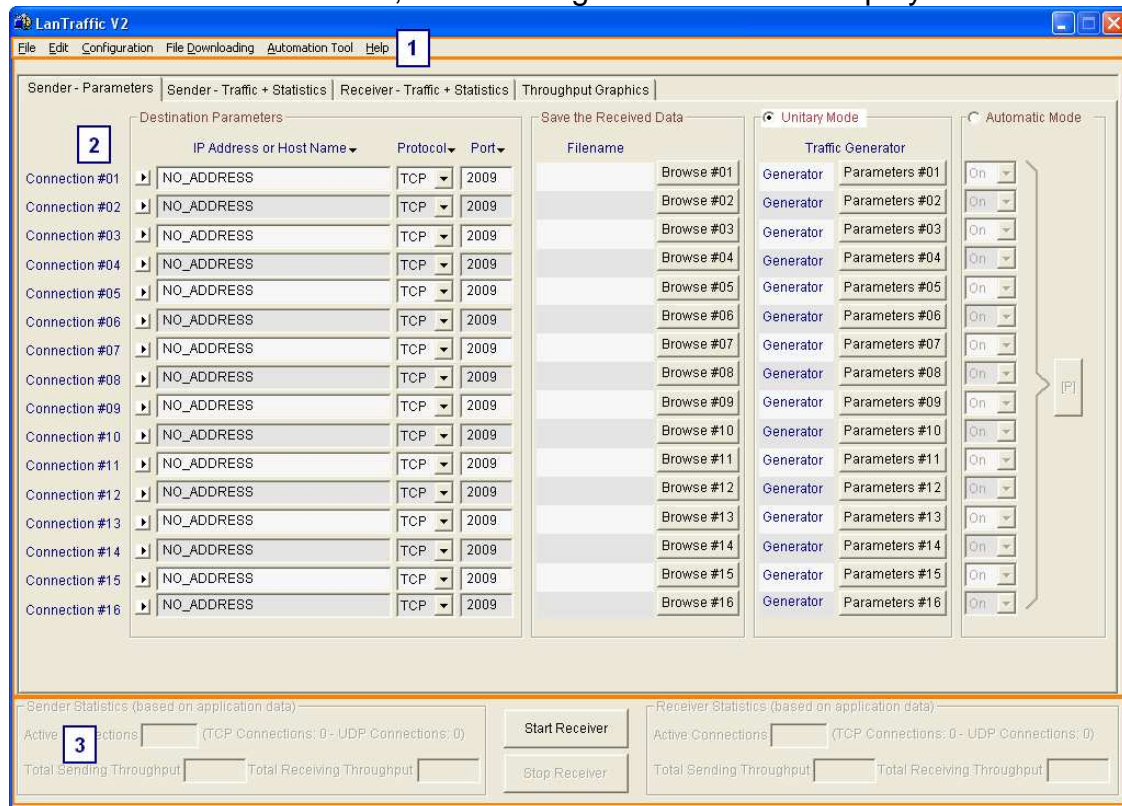

```
%> netsh advfirewall firewall add rule name="SCTP (used by LanTraffic V2)" dir=out action=allow profile=any localip=any remoteip=any protocol=132 interface=any
```

A message of confirmation is returned by *netsh* if the command is succeeded.

Part 9 Graphical User Interface

9.1 Main Window

When **LanTraffic V2** is launched, the following main window is displayed:

LanTraffic V2 main window

The **LanTraffic V2** main window is made of three areas:

- ⇒ **Area 1: Menu bar**
- ⇒ **Area 2:** this main area displays the **four tabs** of **LanTraffic V2**. To see a tab, click on the tab title you want to display.
- ⇒ **Area 3: Statistics** for the Sender and Receiver parts and general command buttons.

'Menu bar' and 'Statistics' are always visible whatever tab is displayed

Tabs general presentation:

LanTraffic V2 GUI is composed of four tabs:

Tabs titles

- The first two tabs are related to the Sender part: “Sender - Parameters” and “Sender - Traffic + Statistics”.
- The third one is related to the Receiver part: “Receiver Traffic + Statistics”.

- In the first three tabs related to Sender and Receiver parts, each one of the 16 connections is represented by one line (from “connection # 01” to “connection #16”). Columns represent parameters or status of connections and statistics.
- The fourth tab allows displaying throughput graphs: “Throughput Graphics”.

Each tab is composed of several areas. For each tab, we will present in this guide each area separately.

9.2 Display general rules of the Graphical User Interface

LanTraffic V2 fields can be filled following four situations:

- Fields in which you can enter values

All the fields in which you can enter or choose values are recognizable by black writing. If an address is not valid, the **red** color is displayed instead of black.

- Statistics fields

Statistics fields are automatically filled. They are identifiable by blue writing. You can only configure the refresh time of statistics display or reset statistics display by pressing the “Reset Display” buttons.

When a statistic value cannot be computed, “N/A” for Not Applicable is displayed in the field.

- Fields generated further to user action and displayed as information use only

These fields are filled automatically by **LanTraffic V2** further to user enter or parameters selection. They are displayed as reminder and will be modified by another user action.

These fields are recognizable by black writing on gray background.

- Fields turned out of reach further to user action

User actions and parameters selection may turn some **LanTraffic V2** GUI fields and action buttons out of reach. Usually all the out of reach fields are grayed.

Fields can become out of reach in several cases, for example:

- As soon as a connection is running, it is impossible to change its parameters. You must stop the connection in order to change the parameters of the connection.
- When a testing mode (unitary or automatic) is selected, it is impossible to change parameters of the unselected testing mode.
- If you enter a non-valid value in a field, the connection could be disabled or actions button in configuration windows could become out of reach.

9.3 Used units for the information display

All information used by **LanTraffic V2** is displayed with its unit and unit is changing in order to limit figure size. In accordance with IEEE Std 260.1 2004, the user can select one of the 2 units to use, using the menu 'Configuration/General Parameters'.

LanTraffic V2 - General Parameters

Refresh Time and Throughput Sampling Period

The refresh time parameter defines the frequency of statistics updates on LanTraffic V2. This parameter also applies to statistics exportation processes. The throughput sampling period defines the number of seconds of traffic needed to calculate the throughput.

Refresh Time (1 to 60 seconds)

Throughput Sampling Period (1 to 60 seconds)

TCP and UDP received Data Timeout

These parameters are for the Sender Part only. When there is no more data to be sent, LanTraffic V2 continues to receive data until the timeout expires. Then the connection is released. When the timeout is 0, the connection is stopped as soon as there is no more data to be sent.

Timeout for TCP Packets echoed (1 to 9,999 ms)

Timeout for UDP Packets echoed (1 to 9,999 ms)

LanTraffic V2 Buffer Size (SO_RCVBUF and SO_SNDBUF)

The buffers used by LanTraffic V2 to dialog with the Winsock API influence the throughput performance for high speed network. The best performance can be reached with a high buffer size. Change in one of these sizes concerns the new connections only.

Receive Buffer Size (1,024 to 65,535 bytes)

Transmit Buffer Size (1,024 to 65,535 bytes)

LanTraffic V2 Measurement Units

Choose one of the unit below (defined by IEEE Std 260.1-2004) to use with the volume and throughput statistics.

☒ Use kilobyte (kB) and kilobit per second (kb/s) where 1 kB:=1,000 bytes and 1 kb/s:= 1,000 bits/s

☐ Use kibibyte (KiB) and kibibit per second (Kib/s) where 1 KiB:=1,024 bytes and 1 Kib/s:= 1,024 bits/s

The LanTrafficV2 unit measurement is saved in the registry, not in the context, because 'Automation for LanTrafficV2' uses the selected unit with some *Commands*.

9.3.1 Volume units

9.3.1.1 Volume kB Unit

Display	Meaning
10 B	10 Bytes
1 kB	1 Kilo Bytes (1,000 Bytes)
1 MB	1 Mega Bytes (1,000,000 Bytes)
1 GB	1 Giga Bytes (1,000,000,000 Bytes)
1 TB	1 Tera Bytes (1,000,000,000,000 Bytes)
1.23^65	1.23 x 10^65 Bytes

9.3.1.2 Volume KiB Unit

Display	Meaning
10 B	10 Bytes
1 KiB	1 Kibibytes (1,024 Bytes)
1 MiB	1 Mibibytes (1,048,576 Bytes)
1 GiB	1 Gibibytes (1,073,741,824 Bytes)
1 TiB	1 Tibibytes (1,099,511,627,776 Bytes)
1.23^65	1.23 x 10^65 Bytes

9.3.2 Throughput units

9.3.2.1 Throughput kb/s Unit

Display	Meaning
10 b/s	10 bits per second
1 kb/s	1 Kilo bits per second (1,000 b/s)
1 Mb/s	1 Mega bits per second (1,000,000 b/s)
1 Gb/s	1 Giga bits per second (1,000,000,000 b/s)
1 Tb/s	1 Tera bits per second (1,000,000,000,000 b/s)
1.23^65	1.23 x 10^65 bits per second

9.3.2.2 Throughput Kib/s Unit

Display	Meaning
10 b/s	10 bits per second
1 Kib/s	1 Kibibits per second (1,024 b/s)
1 Mib/s	1 Mibibits per second (1,048,576 b/s)
1 Gib/s	1 Gibibits per second (1,073,741,824 b/s)
1 Tib/s	1 Tibibits per second (1,099,511,627,776 b/s)
1.23^65	1.23 x 10^65 bits per second

Throughput computing

The **LanTraffic V2** displayed throughputs correspond to payload data on the sampling period (defined in the **LanTraffic V2** configuration menu) and bring back to a bits/second number. The displayed throughput is an “application” throughput. At some instant, it could be different from the physical network throughput because data can be split and buffered at various system levels.

Units changing

To change, a volume value in KiB to a volume value in MiB, **LanTraffic V2** divides the first value per 1024. Ex: 1000 KiB = 0.98 MiB.

The same rule is applied with throughput values. In order to have a throughput in Mib/s coming from a throughput in Kib/s, **LanTraffic V2** divides the first value per 1024. Ex: 2048 Kib/s = 2.00 Mib/s.

To change, a volume value in kB to a volume value in MB, **LanTraffic V2** divides the first value per 1000. Ex: 1000 kB = 1 MB.

The same rule is applied with throughput values. In order to have a throughput in Mb/s coming from a throughput in kb/s, **LanTraffic V2** divides the first value per 1000. Ex: 2000 kb/s = 2.00 Mb/s.

Part 10 Using LanTraffic V2

10.1 Main steps

The main steps to use **LanTraffic V2** are:

⇒ **To send data:**

1. *In Tab 1 "Sender – parameters":*
Configure Sender parameters i.e. IP address, port number, and protocol. You can select the interface and the IP protocol optionally. Then select and configure the testing mode.
2. *In Tab 2 "Sender – Traffic+ Statistics":*
Run connections,
3. Result: exploit statistics and throughput graphs.

⇒ **To receive data:**

1. *In Tab 3 "Receiver - Traffic + Statistics"*
Configure Receiver parameters i.e. connected senders, working mode, and select the interface and the IP protocol optionally.
2. *In Tab 3 "Receiver - Traffic + Statistics":*
Start receiving connections,
3. Result: exploit statistics and throughput graphs.

About the context file

*In order to avoid entering again all parameters for a new testing session, or to create again mathematical laws, all the **LanTraffic V2** parameters can be saved into a context file (see File menu description below).*

So if you want to repeat a test session with the same parameters later, do not forget to save the current parameters in a context file before changing some parameters.

10.2 Menu description

The menu bar is made of 6 items:

File Edit Configuration File Downloading Automation Tool Help

The options for each item are described in this chapter.

10.2.1 File menu

10.2.1.1 File/New

This command opens a new default context in **LanTraffic V2**. Before opening a new default context, running connections must be stopped. The default values of a new context are presented in the Appendix.

10.2.1.2 File/Open

The “Open” command allows reading a context file (.CTX file), which contains a previously saved configuration. Before opening a context, running connections must be stopped.

The context format varies from versions to versions. A context saved with **LanTraffic V2** version 2.0.12, 2.1 to 2.6 is silently read by **LanTraffic V2** version 2.7. Older context cannot be read: an error message is displayed when you attempt to open such a file.

A context file contains configuration parameters and a copy of the laws defined by the user. Reading of a context file will delete currently used laws and replace them by the laws saved in the context file.

10.2.1.3 File/Save

The “Save” option allows saving all the configuration parameters and laws defined by the user in the opened context file.

*If versions 2.0.12, 2.1 to 2.6 contexts were opened, the context file saved get the new format used by **LanTraffic V2** version 2.7: it will not be available to use with an older version of **LanTraffic V2**.*

10.2.1.4 File/Save as ...

This option allows saving all the configuration parameters and laws defined in a context file (.CTX file). The context file saved by the **LanTraffic V2** version 2.7 can't be read by versions 2.6 and older.

10.2.1.5 File/Recent Contexts ...

This option allows opening a context file previously loaded. The 4 most recent context files are shown in the list.

10.2.1.6 File/Exit

This command allows quitting **LanTraffic V2**. To quit **LanTraffic V2**, all active connections (Sender and Receiver) must be stopped. A message box will ask you to save or not changes made for the parameters in a context file.

10.2.2 Edit menu

10.2.2.1 Edit/Destination Parameters: IP Address or Host Name (for Sender)

One option is available:

Copy the IP Address from Connection #01 to all Connections

By selecting this item, the 'IP Address' field from connection #01 is copied out for all connections from #02 to #16.

10.2.2.2 Edit/Destination Parameters: Protocol (for Sender)

Three options are available:

Select TCP for all Connections
Select UDP for all Connections
Select SCTP for all Connections

By selecting one option, the 'Protocol' field for the connections #01 to #16 is set to TCP, UDP or SCTP.

10.2.2.3 Edit/Destination Parameters: Port (for Sender)

Four options are available:

Increase SCTP Ports only (from first SCTP Connection)
Decrease SCTP Ports only (from first SCTP Connection)

Increase TCP Ports only (from first TCP Connection)
Decrease TCP Ports only (from first TCP Connection)

Increase UDP Ports only (from first UDP Connection)
Decrease UDP Ports only (from first UDP Connection)

Increase all Ports (from Connection #01)
Decrease all Ports (from Connection #01)

With this menu, you can:

- Set the port number increasingly or decreasingly for all SCTP connections, based on the port number of the first SCTP connection,
- Set the port number increasingly or decreasingly for all TCP connections, based on the port number of the first TCP connection,

- Set the port number increasingly or decreasingly for all UDP connections, based on the port number of the first UDP connection,
- Set the port number increasingly or decreasingly for all connections, based on the port number of the first connection without taking into account the protocol in use.

10.2.2.4 Edit/Listening To: Port (for Receiver)

Four options are available:

Increase SCTP Ports only (from first Sctp Connection)
Decrease SCTP Ports only (from first Sctp Connection)
Increase TCP Ports only (from first TCP Connection)
Decrease TCP Ports only (from first TCP Connection)
Increase UDP Ports only (from first UDP Connection)
Decrease UDP Ports only (from first UDP Connection)
Increase all Ports (from Connection #01)
Decrease all Ports (from Connection #01)

With this menu, you can:

- Set the port number increasingly or decreasingly for all SCTP connections, based on the port number of the first SCTP connection,
- Set the port number increasingly or decreasingly for all TCP connections, based on the port number of the first TCP connection,
- Set the port number increasingly or decreasingly for all UDP connections, based on the port number of the first UDP connection,
- Set the port number increasingly or decreasingly for all connections, based on the port number of the first connection without taking into account the protocol in use.

10.2.2.5 Edit/Listening To: Protocol (for Receiver)

Three options are available:

Select TCP for all Connections
Select UDP for all Connections
Select SCTP for all Connections

By selecting one option, the 'Protocol' field for the connections #01 to #16 is set to TCP, UDP or SCTP.

10.2.2.6 Edit/Coming From: Remote IP Address or Host Name (for Receiver)

One option is available:

Copy the IP Address from Connection #01 to all Connections
--

By selecting this item, the IP Address field from connection #01 is copied out for all connections from #02 to #16.

10.2.3 Configuration menu

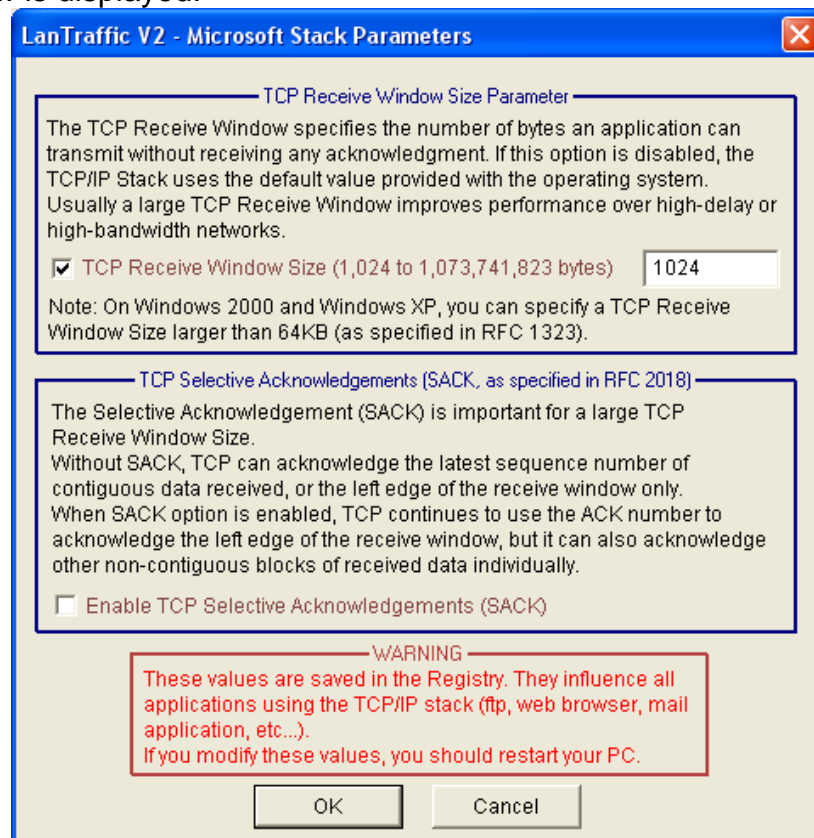

10.2.3.1 Configuration/Stack Parameters (on Windows 2000, XP and Server 2003)

The "Stack Parameters" window is not available with Windows Vista and later. The TCP Window Size and the selective acknowledge are automatically handled by the operating system.

LanTraffic V2 uses the Microsoft TCP/IP stack via the Winsock2 interface (or API). This interface enables modifying some parameters of the Microsoft TCP/IP stack.

LanTraffic V2 enables modifying the TCP Receive Window size and enables the TCP Selective Acknowledgements. When the Stack Parameters command is selected, the following window is displayed:

Stack Parameters window

The TCP Receive Window Size value must be included between 1,024 and 1,073,741,823 bytes.

The "OK" button allows saving changes made to the TCP/IP stack Parameters. If some changes have been made, you must restart your PC.

Important: these values influence all applications using the TCP/IP stack

These parameters are stored in the Registry in the keys:

HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\TCPIP\Parameters
Name: TcpWindowSize & Tcp1323Opts & SackOpts.

10.2.3.2 Configuration/General Parameters

This command allows configuring parameters applied to graphical display, timeouts for echoed connections and the size of buffers used by **LanTraffic V2**.

When selected, the following window is displayed:

LanTraffic V2 - General Parameters

Refresh Time and Throughput Sampling Period

The refresh time parameter defines the frequency of statistics updates on LanTraffic V2. This parameter also applies to statistics exportation processes. The throughput sampling period defines the number of seconds of traffic needed to calculate the throughput.

Refresh Time (1 to 60 seconds)

Throughput Sampling Period (1 to 60 seconds)

TCP and UDP received Data Timeout

These parameters are for the Sender Part only. When there is no more data to be sent, LanTraffic V2 continues to receive data until the timeout expires. Then the connection is released. When the timeout is 0, the connection is stopped as soon as there is no more data to be sent.

Timeout for TCP Packets echoed (1 to 9,999 ms)

Timeout for UDP Packets echoed (1 to 9,999 ms)

LanTraffic V2 Buffer Size (SO_RCVBUF and SO_SNDBUF)

The buffers used by LanTraffic V2 to dialog with the Winsock API influence the throughput performance for high speed network. The best performance can be reached with a high buffer size. Change in one of these sizes concerns the new connections only.

Receive Buffer Size (1,024 to 65,535 bytes)

Transmit Buffer Size (1,024 to 65,535 bytes)

LanTraffic V2 Measurement Units

Choose one of the unit below (defined by IEEE Std 260.1-2004) to use with the volume and throughput statistics.

- ☒ Use kilobyte (kB) and kilobit per second (kb/s) where 1 kB:=1,000 bytes and 1 kb/s:= 1,000 bits/s
- ☐ Use kibibyte (KiB) and kibibit per second (Kib/s) where 1 KiB:=1,024 bytes and 1 Kib/s:= 1,024 bits/s

General Parameters window

Parameters applying to the GUI display

- **Refresh time:** value entered in this field configures display refresh time for all statistics displayed in **LanTraffic V2**.
- **Throughput sampling period:** value entered in this field is used to compute throughput for statistics display.

Parameters applying to echoed connections

- **Timeout for TCP packets echoed (ms):** value entered in milliseconds. This field is used for echoed TCP connections. When the connection is stopping, **LanTraffic V2** continues TCP data acquisition during a time defined by this timeout. If this value equals zero, **LanTraffic V2** doesn't handle any TCP incoming traffic on this connection as soon as the connection is stopped.
- **Timeout for UDP packets echoed (ms):** value entered in milliseconds. This field is used for echoed UDP connections. When the connection is stopping, **LanTraffic V2** continues UDP data acquisition during a time defined by this timeout. If this value equals zero, **LanTraffic V2** doesn't handle any UDP incoming traffic on this connection as soon as the connection is stopped.

Parameters applying to the data buffer size

- **Receive Buffer Size:** this value is saved in the current context only and is used when receiving data from the Microsoft Winsock2 interface.
- **Transmit Buffer Size:** this value is saved in the current context only and is used when sending data to the Microsoft Winsock2 interface.

Parameters applying to measurement units

- **Use kilobyte and kilobit:** in this case a kilobyte is equal to 1000 bytes and a kilobit/s is equal to 1000 bits/s.
- **Use kibibyte and kibibit:** in this case a kilobyte is equal to 1024 bytes and a kilobit/s is equal to 1024 bits/s.

More information are available in paragraph **9.3 Used units for the information display**

10.2.3.3 Configuration/AutoComplete ...

The AutoComplete option is a help feature to input values for the user. It lists possible entries that match user entries typed before. The AutoComplete device with **LanTraffic V2** is available for IP address entries in the "Sender – Parameters" and "Receiver – Traffic + Statistics" tabs.

Example of AutoComplete entry in the "Sender – Parameters" tab.

There are 3 different historical records:

- Historical record for IP address entry in the Sender tab,
- Historical record for IP address entry in the Receiver tab
- Historical record for IP address in the File Downloading dialog box.

The AutoComplete parameters dialog is used to enable/disable and to clear all historical records.

AutoComplete parameters

Up to 30 entries can be kept in the historical record. When a 31st entry is typed, the 1st entry is deleted: the historical record is handled like a FIFO list. The **Clear History** button removes user entries from historical records leaving two predefined entries:

- **NO_ADDRESS**: this is the default Sender IP address - a void address, used to disable the connection.
- **ANY_ADDRESS**: this is the default Receiver IP address, used to accept any incoming connection.

When AutoComplete is disabled, the historical record doesn't continue to be filled. User entries before AutoComplete deactivation will be available when AutoComplete is activated again.

The historical record is associated to the "LanTraffic V2" session.

*For security reason, the historical record is not kept between sessions and is lost at the end of the **LanTraffic V2** session.*

10.2.4 File Downloading menu

File Downloading

This command allows downloading a file from one **LanTraffic V2** machine to another one. In order to avoid confusion, “Local” and “Remote” terms are used to design the machines for this command.

File Downloading is mainly used when a receiving connection is operating in the Absorber File working mode. It is aimed to repatriate the absorbed file from Receiver to Sender, as shown in the following scheme. (Though any file from the remote machine can be downloaded).

Example of File downloading in File absorber receiving working mode environment

1: Remote receiver stores received data in a file (working mode = Absorber File).

2: The user of the Local Sender machine can get the file back by using the File downloading function.

Example of File downloading usage

File Downloading may be used when a receiving connection at the Remote side is operating in Absorber File working mode. It is aimed to repatriate the absorbed file from Receiver to compare it to the file sent by the Sender, as shown in the following scheme. The Remote receiver is configured in Absorber file Mode, for TCP connection. The Local sender establishes a TCP connection and sends data from a file. When the connection is finished, the Sender uses the File downloading function to get received data from the Remote Receiver. So you can check if data transfer was successful.

Process to download a file

When clicking on the File Downloading command, the following window appears:

File downloading window

To process a file transfer, proceed as follows:

On the local and remote machines:

(1) Configure port number – Port number must be the same for local and remote machines.

On the local machine:

(2) Give the name and path of the remote file to download. To be downloaded, the file must not be written or enriched on the remote machine at the same time.

(3) Give the IP address or Host name of the remote machine from where the file is downloaded. IPv4 or IPv6 address can be set up here.

(4) Give the local name of the destination file

(5) Press “Start” button to begin the file downloading from the remote machine

“OK” button allows saving the entered parameters and closes the window.

When “Start” button is on, it is impossible to press OK or to close the window. You should abort it by pressing the “Stop” button or wait for the end of file transfer operation.

*If you use a canonical name, the IP Address Translation mechanism (see § 10.4.1.1.3 IP Address translation mechanism) resolves it. In case of the resolution returns an IPv4 and an IPv6 addresses, **LanTraffic V2** selects the IPv4 address only.*

On the remote machine, the following message box will warn that a file downloading is in progress:

LanTraffic V2 - File downloading in Progress from a Remote	
Remote IP Address:	192.168.0.35
Port Number:	2500
Local Filename downloaded by the Remote:	c:\ReceiverStats.txt
Data volume to send (Bytes):	66776671
Volume of Data remaining (Bytes):	53194335

Warning message displayed on the remote machine from which the file is downloaded

- Remote IP address is the IP address of the machine where the file to download is. This address is never in canonical format. This address can be an IPv4 or an IPv6 address.
- Port number is the port number chosen for file downloading (it must be the same for the remote and local machines).
- Local filename downloaded by remote is the name of the downloaded file.
- Data volume to send is the total volume of the file to download.
- Data remaining volume is the volume still to send.

During a file transfer, you will not be allowed to close the application on the Remote machine.

File downloading is working as follows:

- The Local machine requests the file that is sent by the Remote machine.
- The Local machine establishes the connection.
- The Remote machine accepts the connection and waits for the filename (with a timeout defined by default to 5 seconds).
- When connected, the Local machine sends the filename.
- When the Remote machine receives the filename, it checks if the file exists and send the size (0 means no file or file access error) and data.
- When the Local machine wants to stop the reception of the file, it disconnects.
- When the Remote machine has sent the file, it waits for an ACK (with a timeout - 5s by default).
- When reception of the file is complete the Local machine sends an ACK.
- When the Remote machine receives an ACK (or expiration of the Timeout), it disconnects.

10.2.5 Automation Tool menu

10.2.5.1 Automation Tool/Automation Tool, what for?...

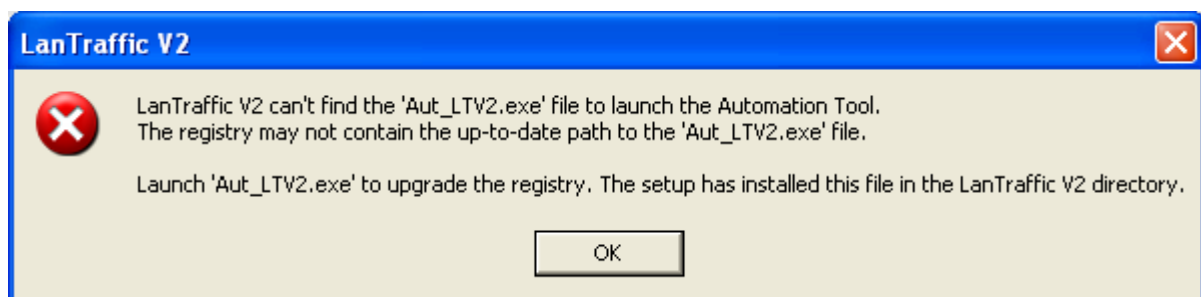

This command opens a window showing a short presentation of the Automation Tool for LanTraffic V2.

10.2.5.2 Automation Tool/Open...

This command starts the “**Automation tool for LanTraffic V2**”.

The “Open...” command is grayed when the “Automation tool for LanTraffic V2” is already started because only one instance can be active.

If the Aut_LTV2.exe file is not located in the same directory than **LanTraffic V2**, an error message is displayed:

10.2.5.3 Automation Tool/Close

This command stops the **Automation tool for LanTraffic V2**.

10.2.5.4 Automation Tool/Bring to the top

This command displays the **Automation tool for LanTraffic V2** window at the top of the other opened applications, except applications that can't be masked e.g. task manager when this option is selected.

10.2.6 Help menu

10.2.6.1 Help/Help

Help command displays help on **LanTraffic V2**. Pressing the **F1** key can also activate help. To display the **LanTraffic V2**'s Help, Acrobat Reader should be installed. If Acrobat reader is not installed, a warning message is displayed:

You can download the latest version from <http://www.adobe.com>, or use the version of Acrobat Reader provided with the **LanTraffic V2**'s CD ROM and install Acrobat Reader.

LanTraffic V2 doesn't support other PDF readers than Acrobat Reader.

10.2.6.2 Help/Forewarnings ...

This command is aimed to inform you of **LanTraffic V2** special behaviors due to system limits. **LanTraffic V2** leans on the Microsoft Winsock 2 Interface to generate and receive TCP or UDP traffic. Therefore the **LanTraffic V2** behavior, as any Winsock 2 application, is dependent of the Winsock 2 Interface, Microsoft TCP/IP stack and operating system working modes.

10.2.6.2.1 Inter packet delay

When defining the inter packet delay, you must consider that the minimum resolution handled by **LanTraffic V2** is related to the timer resolution of the operating system. This timer resolution varies according to the operating system and PC used, as well as CPU and network load when "LanTraffic V2" is operating.

The best timer resolution that "LanTraffic V2" can provide is one millisecond.

LanTraffic V2 operates in the best effort mode to provide the inter packet delay requested by the user.

10.2.6.2.2 Echoer modes

When the Receiver is configured in Echoer mode ('Echoer', 'Echoer file' or 'Generator') it is recommended to use the most powerful PC of the test bed as Receiver (more CPU is required to send data back).

10.2.6.2.3 UDP connections

When several UDP connections are running and according to the traffic level and to the system load, **LanTraffic V2** can have strange behaviors due to the TCP/IP stack limits and working modes.

The current release of the Winsock2 API doesn't provide any system limit information to applications such as **LanTraffic V2**, so the following situations may occur.

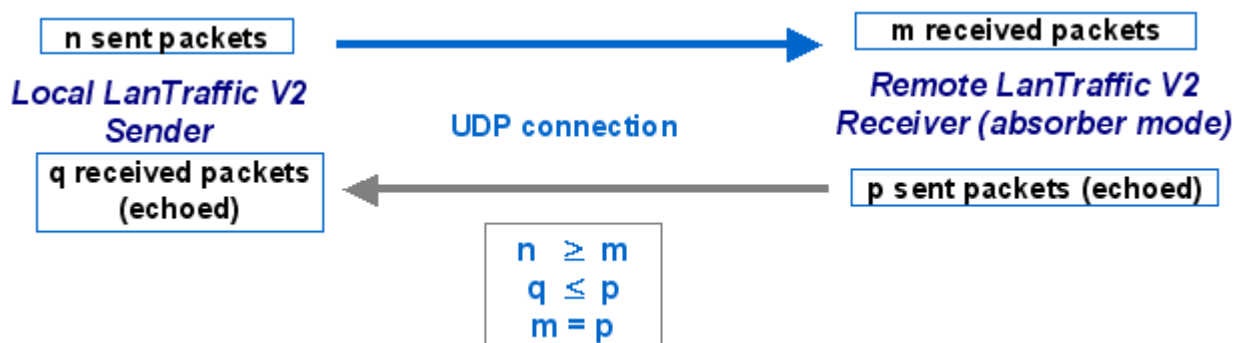

▪ Packets Loss

The Winsock2 interface doesn't transmit all received packets to the **LanTraffic V2** Receiver.

a) UDP connection from Local sender to Remote receiver - the working mode of the remote Receiver is absorber.

b) UDP connection from Local sender to Remote receiver - the working mode of the remote Receiver is echoer.

In this case, the number of received packets (m) will be equal to the number of echoed packets (p) in the Receiver part. Nevertheless, the number of received packets (q) in the Sender part could be inferior to the number of packets (p) sent by the remote Receiver in echoer mode.

▪ UDP connection distribution

When several UDP connections are running together, the TCP/IP stack may favor echoed connections.

Throughput of connections for the Receiver working in absorber mode may decrease to zero for a variable time.

▪ UDP total throughput

The total sending throughput can indicate a higher value than the face value of the physical link throughput

When these situations occur, they can be limited by regulating connections throughput according to the face value of the physical link throughput.

To regulate throughput you can reduce the packet size or increase the inter packet delay for the connections. Another way to curb these limits is to configure the buffer size in the "Configuration / Stack parameters" (with Windows 2000, XP and Server 2003 only) menu or to tune the Microsoft TCP/IP stack.

10.2.6.3 Help/Getting Started (IPv4)

The "Getting Started (IPv4)" command displays the Getting Started procedure.

10.2.6.4 Help/About LanTrafficV2

This command displays the version number and the copyright of the software.

10.3 Total statistics

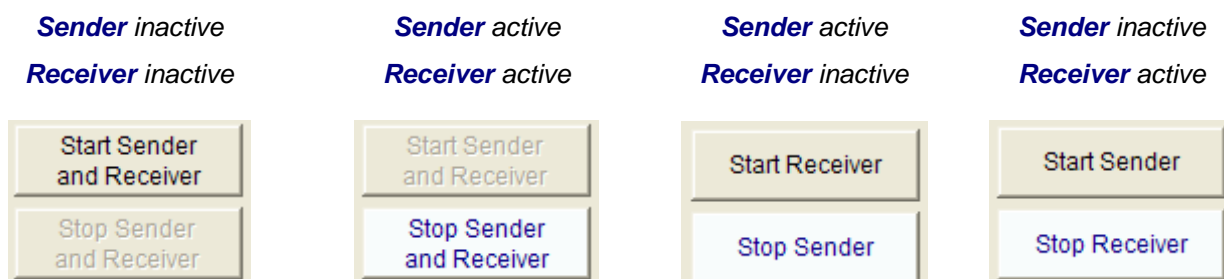

Total statistics for the **Sender** ① and **Receiver** ③ are displayed in the lower part of the **LanTraffic V2** main window.

The statistics display refresh time and the sampling period to compute the throughputs are configured in the “Configuration / General Parameters” menu, as described in 10.2.3.2.

Total statistics displayed in the main window lower part

Two general command buttons ② are also available to start and stop the Sender and the Receiver parts, and the title of these buttons vary according to the activity state of each entity:

10.3.1 Sender statistics

For the Sender tab, the following statistics are displayed:

- **Active connections:** Number of current running connections on the Sender part. More details are displayed: number of TCP, UDP, ICMP and SCTP Sender connections.
- **Total Sending Throughput:** Instant throughput of data sent for all connections of the Sender.
- **Total Receiving Throughput:** Instant throughput of data received. These statistics are available only when some connections are configured in the Echoer or Generator working mode on the Remote Receiver part.

10.3.2 Receiver statistics

For the Receiver tab, following statistics are displayed:

- **Active connections:** Number of current running connections on the Local Receiver part. More details are displayed: number of TCP, UDP and SCTP Receiver connections.
- **Total Sending Throughput:** Instant throughput of all echoing connections sent back from Local Receiver to Remote Sender, or Generator.
- **Total Receiving Throughput:** Instant throughput of all receiving connections.

10.4 The Sender part

The Sender generates up to 16 simultaneous connections. Connections can be generated following two different and exclusive testing modes: Unitary or Automatic.

Sender part is represented in two tabs. The first one "Sender-Parameters" is used to configure connections and testing mode. The second one "Sender-Traffic + Statistics" is used to command the traffic generation and visualize the traffic statistics.

10.4.1 Sender - Parameters tab

The first tab of **LanTraffic V2** allows:

- Selecting the interface and the IP version (when IPv6 is installed) for each connection, by clicking the black arrow .
- Entering the destination parameters (IP address, protocol and port number) for each connection.
- Selecting the files to save received data when connections are working in Echoer mode or Generator mode for the Remote Receiver part.
- Selecting and configuring the testing mode: Unitary or Automatic.
- Configuring the generator: for each connection when the Unitary mode is selected or globally when the Automatic mode is selected.

These actions are represented by the "Sender-Parameters" tab in 4 distinct areas and detailed below.

Destination Parameters				Save the Received Data		Unitary Mode		Automatic Mode	
	IP Address or Host Name	Protocol	Port	Filename		Generator	Parameters		
Connection #01	192.168.0.13	TCP	2009		Browse #01	Generator	Parameters #01	On	
Connection #02	192.168.0.13	UDP	2010		Browse #02	Generator	Parameters #02	On	
Connection #03	192.168.0.13	TCP	2011		Browse #03	Generator	Parameters #03	On	
Connection #04	192.168.0.13	TCP	2012		Browse #04	Generator	Parameters #04	On	
Connection #05	192.168.0.13	TCP	2013		Browse #05	Generator	Parameters #05	On	
Connection #06	192.168.0.13	TCP	2014		Browse #06	Generator	Parameters #06	On	
Connection #07	192.168.0.13	TCP	2015		Browse #07	Generator	Parameters #07	On	
Connection #08	192.168.0.13	TCP	2016		Browse #08	Generator	Parameters #08	On	
Connection #09	192.168.0.13	TCP	2017		Browse #09	Generator	Parameters #09	On	
Connection #10	192.168.0.13	TCP	2018		Browse #10	Generator	Parameters #10	On	
Connection #11	192.168.0.13	TCP	2019		Browse #11	Generator	Parameters #11	On	
Connection #12	192.168.0.13	TCP	2020		Browse #12	Generator	Parameters #12	On	
Connection #13	192.168.0.13	TCP	2021		Browse #13	Generator	Parameters #13	On	
Connection #14	192.168.0.13	TCP	2022		Browse #14	Generator	Parameters #14	On	
Connection #15	192.168.0.13	UDP	2023		Browse #15	Generator	Parameters #15	On	
Connection #16	192.168.0.13	UDP	2024		Browse #16	Generator	Parameters #16	On	

Tab 1: "Sender – Parameters"

10.4.1.1 Destination parameters

Located at the left part of the tab, this area allows configuring the destination parameters of each sending connection. You can enter the following information:

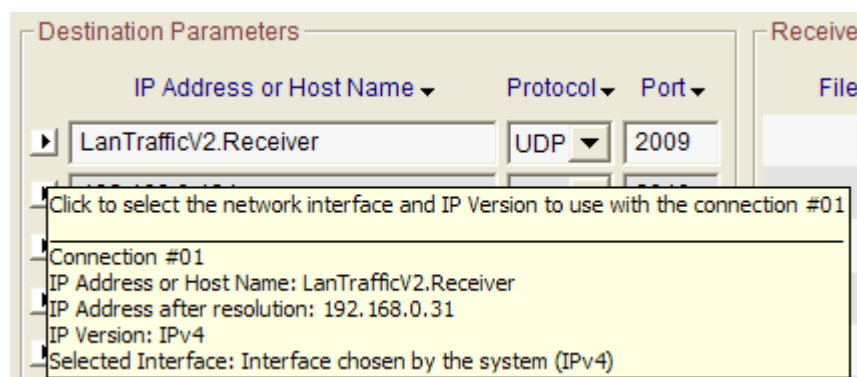

Network interface selection and IP version 	<p>The black arrow has two purposes:</p> <ul style="list-style-type: none"> • To display a summary of the connection parameters. • To select the network interface, the IP version or the IP source address for a connection.
IP address or Host Name	<p>IP address should be entered following the numerical writing of IP address (i.e. xxx.xxx.xxx.xxx) or using the canonical format (e.g. an URL). The default IP address is NO_ADDRESS (0.0.0.0 for IPv4). Once the value entered, verification is made and the field becomes red if the value is invalid.</p>
Protocol	TCP, UDP, ICMP or SCTP protocol (default = TCP protocol).
Port**	<p>The port number is limited to 65,535. By default, the entered port number is 2009. In case of invalid value, the value is red colored.</p>

* Not available with SCTP connections

** Not available with ICMP connections

10.4.1.1.1 Summary of connection parameters

When you move the mouse over the black arrow, a popup window - called a **tooltip**, is displayed:

Sender connection tooltip

The tooltip for the Sender connection includes 5 items:

- The first item is the connection number the tooltip refers to.
- The next item is the IP address or Host Name defined by the user.
- The next item is the IP address translated when IP Translation address has succeeded (e.g. the address is not NO_ADDRESS or 0.0.0.0).
- The next item is the IP version currently selected.
- The last item is the interface name selected. The name displayed is the name of the connection presented in the "Settings/Network and Dial-up Connections" Start menu of the operating system (Default is "Interface chosen by the system").

10.4.1.1.2 Select the network interface, IP version and source IP address (except for SCTP)

When you click on the black arrow, a window is displayed:

Network interface, IP version and IP source address for a Sender connection

(1) The **network interface** selection is optional with IPv4. It is used to select the IPv6 or to force connections to be established using a specific interface.

- By default:
 - The IP version is automatically selected by **LanTraffic V2** regarding the destination address or host name specified on the “Sender - Parameters” tab (see below).
 - The IP stack resolves the interface selection to send packets to the remote. The IP stack uses the destination IP address to select the correct interface. IP address and netmask related to each interface are checked against the remote IP address to reach. When an interface that matches the remote IP address is found, it is used. To understand how the IP stack selects the interface, you may enter ‘route print’ console command to list the interface order, the IP address and the network address mask.
- You can select one interface from the list of the connected interfaces. **LanTraffic V2** will only use the selected interface to translate IP address and to make a connection. You must select the interface compatible with the remote IP address you want to reach. When the IP address translation failed, the current connection parameters area is updated as follows:

- Interface types are restricted: only Ethernet and PPP are listed. A PPP interface should be in a 'connected' state to belong to the interface list.

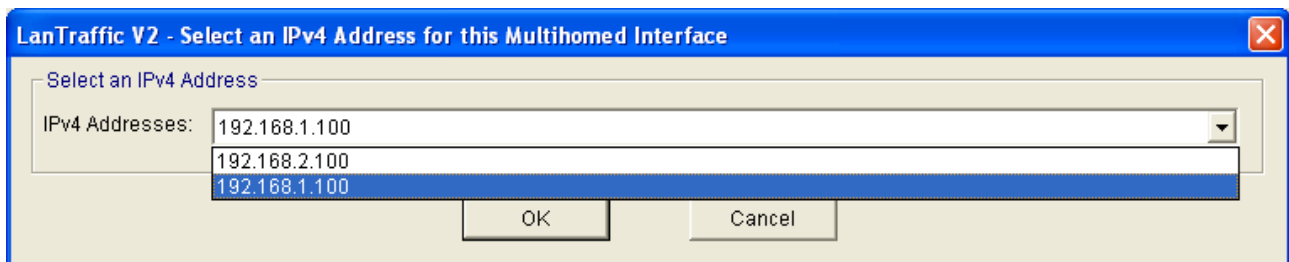

(2) The IP version selection is available:

- with all Windows versions, from Windows XP
- with Windows XP or Server 2003, if IPv6 features are not installed on the target machine, please refer to the Windows XP or Windows Server 2003 documentation to install the IPv6 stack.
- You can allow **LanTraffic V2** to choose automatically the good IP version regarding the address or host name resolution result. If a canonical name corresponds at the same time to an IPv4 and IPv6 address, **LanTraffic V2** chooses the IPv4 address. To use the IPv6 address, you should leave the automatic selection mode and specify the use of IPv6.

If you have selected an IP version, the IP address translation (see 10.4.1.1.3) uses the current selected IP version to get the IP address numerical form.

(3) Select IP address is available when multiple IP addresses are attached to the network interface. This interface configuration is also known as 'multihomed' interface. The selection of a Source IP address is generally not required: **LanTraffic V2** uses the default IP address of the interface to establish connections. It may be useful when routing priority or policy is defined.

Example of an IP address selection for a multihomed interface:

Select IP address is not available if the default interface 'Interface chosen by the system' is selected.

(4) Specification of the local source port number is disabled by default. In this case, the system automatically chooses the source port number for any connection generating traffic. In order to respect the rules of a firewall for example, the source port number can be user defined.

(5) 'Current parameters of this connection' area is an abstract for the connection. It summarizes the IP address, the numerical IP address format, the IP version and the interface selection.

- The source port used is dynamically updated with the user selection.
- IP addresses are static. The IP address translation will process when you click on OK only.
- IP version field is dynamically updated with the user selection.
- Current interface is dynamically updated with the user selection.

When you click on the OK button if the interface selected or IP version has changed, the IP address translation is automatically started. [It may be time consuming.](#)

10.4.1.1.3 IP Address translation mechanism

LanTraffic V2 tries to translate – e.g. to resolve - the IP address from a canonical to a numerical format. This operation is called the *IP address translation mechanism*. When the 'IP Address or Host Name' field or Interface parameters changes, when you move from 'IP Address or Host Name' field to another field, or to another tab, when the Enter key is pressed or when the Interface parameters change, all of these actions start the IP address translation function.

Because the IP address translation mechanism is time consuming, you should be careful when using IP canonical addresses. The time consumption depends on the DNS answer speed, the number of DNS configured and the network load when the DNS request is sent.

If network environment changes – e.g. a new DNS has been defined - you should press the Enter key in the 'IP Address or Host Name' field to force **LanTraffic V2** to restart the translation mechanism for this connection.

When the IP address translation failed, the IP address is written in red on a white background. This connection cannot be started: the "Run" button in the 'Sender – Traffic + Statistics' tab is grayed.

*To summarize, the **IP address translation** mechanism is activated when:*

- *the focus leaves the 'IP Address or Host Name' field,*
- *another tab is selected,*
- *you duplicate parameters from one connection to another,*
- *you change the Interface parameters,*
- *a context file is loaded.*

If no IP version has been selected, the IP address translation mechanism chooses the good IP version regarding the IP version returned by the resolution process. If for example, a canonical name represents at the same time an IPv4 and an IPv6 addresses, the IP Address Translation mechanism chooses the IPv4 address. If you want to use the IPv6 address, you should select IPv6 version (see above).

10.4.1.1.4 Duplicate parameters of a connection onto others

In order to facilitate the input of these parameters, a *copy/paste mechanism* for all parameters of a connection is available. This mechanism is not available when the canonical IP address cannot be translated into numerical format.

Duplication of connection parameters doesn't copy the interface information. When you copy a connection to another one, the IP address translation mechanism is started.

Step 1: first input parameters for a connection (by example, connection #01)

Sender - Parameters		Sender - Traffic + Statistics		Receiver - Traffic + Statistics	
Destination Parameters					
	IP Address or Host Name	Protocol	Port		
Connection #01	192.168.0.13	TCP	2010		
Connection #02	NO_ADDRESS	TCP	2009		
Connection #03	NO_ADDRESS	TCP	2010		

Step 2: move the mouse cursor on the 'Connection #1' label (source). The mouse cursor appears as shown beside.

Sender - Parameters		Sender - Traffic + Statistics		Receiver - Traffic + Statistics	
Destination Parameters					
	IP Address or Host Name	Protocol	Port		
Connection #01	192.168.0.13	TCP	2010		

Step 3: mouse click left. Then the 'Connection #1' label is blue colored.

Sender - Parameters		Sender - Traffic + Statistics		Receiver - Traffic + Statistics	
Destination Parameters					
	IP Address or Host Name	Protocol	Port		
Connection #01	192.168.0.13	TCP	2010		

Step 4: when you move the mouse cursor on one another, 'Connection #02' label for example, the mouse cursor changes.

Sender - Parameters		Sender - Traffic + Statistics		Receiver - Traffic + Statistics	
Destination Parameters					
	IP Address or Host Name	Protocol	Port		
Connection #01	192.168.0.13	TCP	2010		
Connection #02	NO_ADDRESS	TCP	2009		

(Copy mode)

Step 5: then you can paste all parameters of connection #01 to the desired connection (#02 for example as target). Put the mouse cursor on the 'Connection #02' label and then use the left mouse button.

Sender - Parameters		Sender - Traffic + Statistics		Receiver - Traffic + Statistics	
Destination Parameters					
	IP Address or Host Name	Protocol	Port		
Connection #01	192.168.0.13	TCP	2010		
Connection #02	192.168.0.13	TCP	2010		

Note: this copy/paste function allows copying parameters from one connection (source) to another one (target). Repeat this process for other connections if needed.

10.4.1.1.5 IP address floating menu

When the mouse is located on the 'IP address' text area, the color changes to white and the following tooltip is displayed:

IP Address or Host Name	Protocol	Port	Filename
192.168.0.13	TCP	2010	

Click to copy the IP address from connection #01 to all connections

Click on the left mouse button to display the short menu as below:

Destination Parameters		Save the Receiver	
IP Address or Host Name	Protocol	Port	Filename
Connection #01	192.168.0.13	TCP	2009

Copy the IP Address from Connection #01 to all Connections

With this function the IP Address field from connection #01 is copied out on all connections from #02 to #16.

10.4.1.1.6 Protocol floating menu

When the mouse is located on the 'Protocol' text area, the color changes to white and the following tooltip is displayed:

Click on the left mouse button to display the short menu as below:

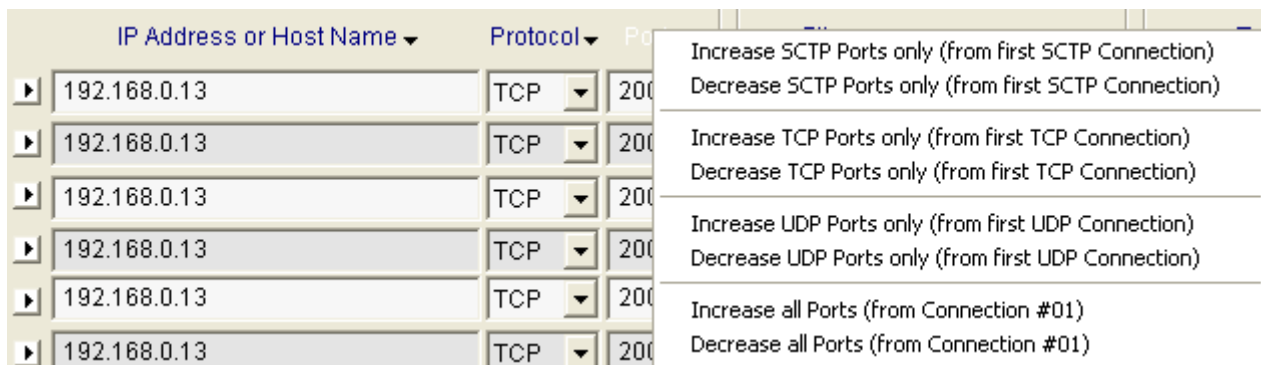

This menu helps to set the same protocol for all connections.

10.4.1.1.7 Port floating menu

When the mouse is located on the 'Port' text area, the color changes to white and the following tooltip is displayed:

Click on the left mouse button to display four items menu as following:

With this menu, you can:

- Set the port number increasingly or decreasingly for all SCTP connections, based on the port number of the first SCTP connection,
- Set the port number increasingly or decreasingly for all TCP connections, based on the port number of the first TCP connection,
- Set the port number increasingly or decreasingly for all UDP connections, based on the port number of the first UDP connection,
- Set the port number increasingly or decreasingly for all connections, based on the port number of the first connection without taking into account the protocol in use.

10.4.1.2 Save the Received Data (except for SCTP and ICMP connections)

When the Remote Receiver part is operating in echoer working mode for a connection, you can select from this area a file name where received data for this connection will be saved. A Browse button allows an easy file selection.

10.4.1.3 Configure the Unitary Mode for TCP, UDP and/or SCTP connections

Unitary mode is one of the two testing mode offered by the **LanTraffic V2** Sender part. Notice that each testing mode is exclusive, i.e. it is impossible to mix connections in unitary testing and automatic testing modes.

The Unitary Mode is configured in Tab 1 “Sender parameters” and run from Tab 2 “Sender Traffic + Statistics”.

To run or configure unitary testing session, you must first select “Unitary Mode”.

By pressing “Parameter # n” buttons, the following parameters can be configured for each connection:

- Traffic generator type: Packets generator, mathematical law or file to send,
- Data size and packets parameters: data size, inter packet delay, RTT option (RTT: Round Trip Time), DSCP value – TTL (Time To Live) value if IPv4 or Hop Limit if IPv6.
- Optional: activate a throughput limit.

The traffic generator **Type** of a connection #n is reminded beside the 'Parameters #n' button: **Generator**, **File** or **Law**.

When you click on 'Parameter #n' in Tab 1 “Sender – Parameters” then the Parameters window is displayed.

This window is divided in several areas: Traffic generator type, Data size and packet parameters, and the optional throughput limit. The connection number is reminded in the window title. “OK” button allows validating new entered parameters for the connection and closes the window.

LanTraffic V2 - Traffic Generator Parameters for the Unitary Mode (connection #03)

Step1: Select the traffic generator type
First select the traffic generator which is going to be used on this connection.

☒ Packets Generator
Packets number (0 to 99,999,999) (0 = infinite value)

Packet Contents (00 to FF hexa byte)

☒ Fixed
☐ Randomized min max
☐ Alternated value-1 value-2
☐ Increasing / Decreasing min max step

☐ Mathematical Law
Law: Data volume to send: Edit...

☐ File to send
Filename: Browse

Loop counter (1 to 99) Idle time between each loop (0 to 99 s)

Step2: Specify data size and packets parameters
In this step, define data size and packets parameters as well as the delay between each sent packet or specify values for some IP header fields.

TCP Data Size (1 to 65535 bytes)

☒ Fixed
☐ Randomized min max
☐ Alternated size-1 size-2
☐ Increasing / Decreasing min max step

Inter Packet Delay (0 to 9,999 ms)

☒ Fixed (See FOREWARNINGS menu please)
☐ Randomized min max
☐ Alternated value-1 value-2
☐ Increasing / Decreasing min max step
☐ Mathematical Law Edit...

RTT Option ☐ Yes ☒ No DSCP (1 hexa byte) Value (0x00 to 0x3F) Time To Live (TTL) Value

Step 3 (Optional): Enable a throughput limit
When one of these two options is selected, LanTraffic V2 generates the traffic with best effort to respect the throughput chosen.

Mean Throughput (8 to 999,999 kb/s)

☐ Use value ☒ Inter Packet Delay adjusted by LanTraffic V2 automatically
☐ TCP or UDP Data Size adjusted by LanTraffic V2 automatically

Mean Throughput (1 to 99,999 Pkts/s)

☐ Use value (except for TCP connection)

OK Cancel Help

Unitary testing parameters window (IPv4)

10.4.1.3.1 Step 1: select the traffic generator type for this connection

The first parameter to configure is the data source type. Three exclusive types of data source are offered:

- Packets Generator (Packets generator parameters)
- Mathematical law (Law: Data volume to send)
- File to send (Filename)

10.4.1.3.1.1 Packets Generator

When the Packet Generator data source is selected, **LanTraffic V2** will generate an user-defined packets content for this connection.

Packets Generator parameters

▪ Packets number

Number of packets to send is limited to 99,999,999. Zero value means infinite and is the default value.

▪ Packet contents (00 to FF hexa byte)

The Content is in hex-byte. Accepted values are all combinations from 00 to FF. The packet contents can be configured as follows:

- **Fixed:** each packet has the same content.
- **Randomized:** **LanTraffic V2** computes random packet content included in a user-defined range (min to max).
- **Alternated:** **LanTraffic V2** uses the first value (value-1) for odd packets and the second value (value-2) for even packets.
- **Increasing/Decreasing:** the content of each packet varies in a user-defined range from the minimal to the maximal value. Each following packet content is incremented by the step value (0 is an invalid value). When the maximal value is reached, the packet content decreases down to the minimal value by the step value.

Statistics: when the traffic generator type is selected, the 'Volume to send' and the 'Remaining volume' statistics cannot be calculated. In statistics fields of the "Sender - Traffic + statistics" tab, "N/A" will be displayed.

10.4.1.3.1.2 Mathematical law

For the unitary testing mode, the mathematical law is a data volume to send law. Volume will impact the duration of the connection.

LanTraffic V2 unitary testing mode offers four mathematical laws related to the data volume:

- Uniform law
- Exponential law
- Pareto law
- Gauss law

These laws are presented in details in the Appendix.

In the “Law: data volume to send” sub-area a list box allows to select an existing law. The main features (type of mathematical law and values range) of the selected law are reminded below the List box.

You can add, modify or delete a law by pressing the “Edit” button. Then a new window is displayed:

Edit data volume to send law

- (1) The '**Law List**' area displays the list a existing law identified by the Law Name, the Law Type (one of the 4 mathematical laws) and the range of values. The Law Name is an editable area used to change the name of the law. To change the Law Name, you click in the list on the name you want to change or you use the **Rename** button.
- (2) There are 5 buttons to modify the list of laws :
 - **New Law:** This button should be used to create a new law (see below for more details).
 - **Rename:** This button is used to change the law name like when you click on the law name.
 - **Copy:** This button increases the way to create a law from an existing one.
 - **Delete:** This button should be used to delete an existing law. You should confirm the deletion.
 - **Save:** This button should be used to save any modification in the law list.
- (3) The '**Type of Law**' area displays the 4 mathematical laws. It should be used to select the law type of the Law. When the Law Type changes, the law parameters may be checked against an unexpected range of values.
- (4) The '**Law Parameters**' or '**Mathematical Theory**' tabs display either the parameters of the law or the related Mathematical Theory of the current selected law. The number of parameters and the Mathematical Theory depend on the selected type of law. The next figure illustrate the Pareto law Mathematical Theory:

(See Appendix 14.1 Mathematical laws used by LanTraffic V2 for more details about Mathematical laws).

- (5) The '**Law Parameters**' area allows entering values of the law. Depending on the law, the parameters and the user help regarding specific statistical values change, as shown below:

- Uniform Law:

Law Parameters

Alpha:

Beta: must be > Alpha

Calculated Range: **From 1 ms to 10 ms**

Information on mathematical law values generated

The minimum value is **1**

The maximum value is **10**

The probability of each value between Alpha and Beta is around: **11.1111%**

If not between Alpha and Beta, the probability of a value is null

- Exponential Law:

Law Parameters

Lambda: must be > 0

Calculated Range: **From 0 ms to 221 ms**

Information on mathematical law values generated

The minimum value is: **0**

The maximum value is: **221**

% of generated values are sitted after the value: **99**

The probability of the integer value (> 0) is around: **9.0484%**

For a cumulative frequency:

from 0 to (integer > 0) equal to % you should choose a
lambda equal to: **0.0100503**

from (integer > 0) to infinity equal to % you should choose a
lambda equal to: **4.6051702**

- Pareto Law:

Law Parameters

a: must be > 0

Beta: must be > 0

Calculated Range: **From 10 ms to 2 h 46 mn**

Information on mathematical law values generated

The minimum value is: **10**

The maximum value is: **1.0e+007**

% of generated values are sitted after the value: **2.0e+005**

The probability of the integer value (integer >= a) is around: **N/A**

For a cumulative frequency:

from a to (integer > a) equal to % you should choose a beta equal to: **N/A**

from (integer > a) to infinity equal to % you should choose a beta equal to: **N/A**

- Gauss Law

Law Parameters

Average: must be > 0

Standard Deviation: must be > 0 and <= Average/3

Calculated Range: **From 0 ms to 17 ms**

Information on mathematical law values generated

The minimum value is: **0**

The maximum value is: **17**

99.73% of the values are included in **[7;13]**

The probability of the integer value is around: **< 0.0001%**

- (6) The 'Restore Defaults' button change the values of the two parameters respectively to 10 and 1 (when the second parameter applies).

To add a new data volume to send law:

1. Press the “New Law” button, then a new Law List Entry is created, with the ‘Uniform Law’ as default Law Type :

LanTraffic V2 - Inter Packet Delay

Law Name	Law Type	Range
Default	Uniform Law	0 ms to 5 ms
Close delay law	Uniform Law	10 ms to 20 ms
Far off delay law	Uniform Law	500 ms to 1 s
Variable delay law	Uniform Law	1 ms to 1 s
New Law	Uniform Law	1 ms to 10 ms

Buttons: New Law, Rename, Copy, Delete, Save

Select a law and define its parameters

Select a type of law: Uniform Law

Law Parameters | Mathematical Theory

Law Parameters:

Alpha:

Beta: must be > Alpha

Calculated Range: **From 1 ms to 10 ms**

Information on mathematical law values generated

The minimum value is **1**

The maximum value is **10**

The probability of each value between Alpha and Beta is around: **11.1111%**

If not between Alpha and Beta, the probability of a value is null

Restore Defaults ...

OK Cancel

2. Rename the Law by using the Rename button or by editing the Law Name
3. Select the requested mathematical Law Type: Exponential, Uniform, Pareto or Gauss.
4. Enter parameters value for the selected mathematical law (1 or 2 parameters are required depending on the selected law),
5. Repeat operation 1 to 4 to create other laws.
6. Press the ‘Save’ button to register changes. Your last law is selected in the parent window when you press the OK button.

Range is computed automatically each time you modify the parameters of the law.

Laws created from this window will also be available in the Automatic testing mode.

10.4.1.3.1.3 File to send

With this selection **LanTraffic V2** sends the file defined in the 'Filename' sub-area. The 'Browse' button is made to ease the “file to send” selection.

The **Loop counter** should be greater than 0. Each time the file is sent, the loop counter decreases and when the 0 value is reached, the traffic generator stops.

Idle time between each loop is expressed in seconds. It defines a pause between two file transfers. It is recommended to define a value lower than the remote TCP/IP timeout if the TCP protocol is used (default TCPTIMEOUT value is 5 seconds) because the remote disconnects when the timeout is reached.

10.4.1.3.2 Step 2: Specify data size and packets parameters

10.4.1.3.2.1 Data Size

This parameter defines the size of data transmitted for each packet.

The maximum accepted value depends on the protocol:

- For TCP and SCTP, the maximum Data Size is **65,535**.
- For UDP, the maximum Data Size is **65,507**.

0 (null) is not a valid value. By default, the entered value is 1,460. This value is the default payload for TCP with IPv4. When IPv6 is selected, the payload should be shorter. Packet size can be configured as follows:

- **Fixed:** each packet has the same size. The last packet may have an inferior size to fit the data volume to send when mathematical law or file to send data source is selected.
- **Randomized:** **LanTraffic V2** computes a random packet size included in a range specified by the user for each packet to send.
- **Alternated:** two values must be defined. **LanTraffic V2** uses the first value for odd packets and the second value for even packets.
- **Increasing/Decreasing:** the size of each packet varies in a range defined by the user, from the minimal to the maximal value. Each size is incremented by the step value (0 is an invalid value). When the maximal value is reached, the packet size decreases step by step until the minimal value.

It is important to note that **LanTraffic V2** requires a minimal packet size when the RTT mode is selected, to add a CRC, a sequence number and the timestamp. Therefore the minimal packet size with RTT mode active is 14 bytes (see paragraph 10.4.1.3.2.3 about the RTT option).

10.4.1.3.2.2 Inter Packet Delay

This parameter allows defining the time interval between two packets. Values are limited to 9,999 milliseconds i.e. 10 seconds. A value of zero means no inter-packet delay.

The inter-packet delay can be configured as follows:

- **Fixed:** inter-packet delay is the same for all transmitted packets.
- **Randomized:** **LanTraffic V2** computes a random inter-packet delay included in a range specified by the user for each packet to send.
- **Alternated:** two values must be defined. **LanTraffic V2** uses the first value for odd packets and the second value for even packets.
- **Increasing/Decreasing:** inter-packet delay varies in a range defined by the user, from the minimal to the maximal value. Each inter-packet delay is incremented by the step defined by the user (0 is not an accepted value for step). When the maximal value is reached, inter-packet delay decreases by the step value down to the minimal value.
- **Mathematical law:** the user chooses between one of the fourth available laws (Uniform, Exponential, Pareto and Gauss).

10.4.1.3.2.3 RTT option

When 'Yes' is selected, **LanTraffic V2** adds RTT (Round Trip Time) header information into packets without changing the data size defined.

The RTT header format is:

- 4 bytes magic number
- 4 bytes sequence number
- 4 bytes time when sent
- 4 bytes length (without the RTT header)

This information is used in conjunction with connections running in echoer mode on the Remote Receiver part. Each echoed packet is analyzed by the Local Sender part. When RTT header is found, RTT is computed and can be saved in a file specified in Tab 1 "Sender – Traffic + Statistics" (see paragraph 10.4.1.2). At the Remote Receive side, RTT information is checked to update 'sequencing errors' and jitter statistics.

10.4.1.3.2.4 The DSCP field (with IPv4 only)

This field is available only if IPv4 is selected for the corresponding connection. Under Windows Vista and later, the DSCP field is not available for SCTP and ICMP connections.

You can input a DSCP value (by default, DSCP = 00) used for each packet sent on the IP connection.

The Differentiated Services Code Point is a selector for router's per-hop behaviors. Because it is a selector, there is no implication that a numerically greater DSCP implies a better network service. The RFC 2474 redefined the Type of Service Byte to be:

7	6	5	4	3	2	1	0
Differentiated Services Code Point						ECT	CE

The ECT and CE fields don't refer to the DiffServ quality of service. They are spare bits in the IP Header used by the Explicit Congestion Notification (see RFC 3168 for more details).

This leads the notion of "class", each class being a group of the DSCPs with the same *Precedence* value. Values within a class offer similar network services but with slight differences (different levels of service such as "gold", "silver" and "bronze").

From the initial definition of the RFC 2474, RFC 2697 added the "assured forwarding" service and RFC 2598 defined the "expedited forwarding" service.

The DSCP values are defined as following:

DSCP (Hexa value)	Service	IP header TOS field value in hexadecimal (if ECT = 0 and CE = 0)
0 (0x00)	Best effort	0x00
8 (0x08)	Class 1	0x20
10 (0x0A)	Class 1, gold (AF11)	0x28
12 (0x0C)	Class 1, silver (AF12)	0x30
14 (0x0E)	Class 1, bronze (AF13)	0x38
16 (0x10)	Class 2	0x40
18 (0x12)	Class 2, gold (AF21)	0x48
20 (0x14)	Class 2, silver (AF22)	0x50
22 (0x16)	Class 2, bronze (AF23)	0x58
24 (0x18)	Class 3	0x60
26 (0x1A)	Class 3, gold (AF31)	0x68
28 (0x1C)	Class 3, silver (AF32)	0x70
30 (0x1E)	Class 3, bronze (AF33)	0x78
32 (0x20)	Class 4	0x80
34 (0x22)	Class 4, gold (AF41)	0x88
36 (0x24)	Class 4, silver (AF42)	0x90
38 (0x26)	Class 4, bronze (AF43)	0x98
40 (0x28)	Express forwarding	0xA0
46 (0x2E)	Expedited forwarding (EF)	0xB8
48 (0x30)	Control	0xC0
56 (0x38)	Control	0xE0

10.4.1.3.2.4.1 How to allow the use of the DSCP field on Windows 2000, XP and Server 2003

Using Registry Editor inaccurately can cause serious problems that may require you to reinstall your operating system. Microsoft cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Note that you should back up the registry before editing it. If you are running Windows 2000 or XP you should also update your Emergency Repair Disk (ERD). For information about how to edit the registry, view the "Changing Keys and Values" Help topic in Registry Editor (regedit.exe) or the "Add and Delete Information in the Registry" and "Edit Registry Data" Help topics in regedit.exe.

Step1: Start Registry Editor (regedit.exe). Go to the following key on Local Machine:

HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Tcpip\Parameters

Step 2: On the Edit menu, click Add Value, and then type DisableUserTOSSetting. Click REG_DWORD in the Data Type box, and then click OK. Enter 0 in the prompt box. Quit Registry Editor, and then restart the computer.

10.4.1.3.2.4.2 How to allow the use of the DSCP field on Windows Vista and later

On Windows Vista and later, the DSCP field is available for TCP and UDP only. Moreover, to be allowed to use the DSCP field, you must have the administrator rights. You must launch LanTraffic V2 using the shortcut **Start > All Programs > LanTraffic V2 > LanTraffic V2 (Run as administrator)**.

10.4.1.3.2.5 The TTL field

<p>IPv4</p>	or	<p>IPv6</p>	<p>The user can input the TTL/Hop Limit value (hexadecimal) used for each packet sent on the connection. Default value = 00. TTL is not available with SCTP.</p>
--------------------	----	--------------------	--

10.4.1.3.3 **Step 3 (optional): Activate a throughput limit**

For the TCP connection, the mean throughput limit is expressed in Kb/s (or Kbps):

Step 3 (Optional): Enable a throughput limit

When one of these two options is selected, LanTraffic V2 generates the traffic with best effort to respect the throughput chosen.

<p>Mean Throughput (8 to 999,999 kb/s)</p> <p><input type="checkbox"/> Use value 50</p> <p><input checked="" type="radio"/> Inter Packet Delay adjusted by LanTraffic V2 automatically</p> <p><input checked="" type="radio"/> TCP or UDP Data Size adjusted by LanTraffic V2 automatically</p>	<p>Mean Throughput (1 to 99,999 Pkts/s)</p> <p><input type="checkbox"/> Use value (except for TCP connection) 10</p>
---	--

With this feature, you can define a throughput limit for this connection (in Kilo bits per second) with the 'Use value' check box. You specify the mean throughput in Kbps in the edit box and select one of the two parameters (packet size or inter packet delay). **LanTraffic V2** will automatically adapt data traffic generation with adjustment of packet size or inter packet delay (user choice) up to the throughput requested by the user.

For a UDP or SCTP connection, the mean throughput is expressed in kb/s or in Kib/s, or it can also be expressed in number of packets per second (Pkts/s):

Step 3 (Optional): Enable a throughput limit

When one of these two options is selected, LanTraffic V2 generates the traffic with best effort to respect the throughput chosen.

<p>Mean Throughput (8 to 999,999 kb/s)</p> <p><input type="checkbox"/> Use value 50</p> <p><input checked="" type="radio"/> Inter Packet Delay adjusted by LanTraffic V2 automatically</p> <p><input checked="" type="radio"/> TCP or UDP Data Size adjusted by LanTraffic V2 automatically</p>	<p>Mean Throughput (1 to 99,999 Pkts/s)</p> <p><input type="checkbox"/> Use value (except for TCP connection) 10</p>
---	--

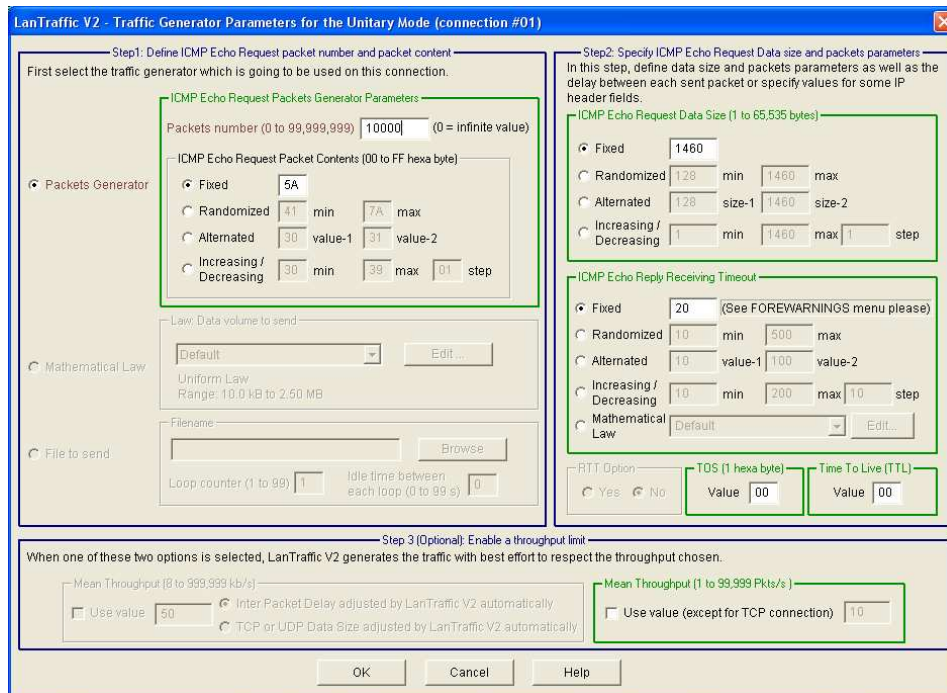

The throughput value must be greater than or equal to 8 Kbps.

10.4.1.4 Configure the Unitary Mode for ICMP connections

LanTraffic V2 offers the possibility to generate ICMP Echo Request traffic (the protocol used by Ping), which can use IPv4 or IPv6 IP version.

The ICMP protocol is available with the unitary mode only. You are still allowed to use TCP and/or UDP on other connections. By pressing the “Parameters #n” button, the window below is displayed:

Three areas are proposed to configure the Ping Simulator:

- In the Step 1, the packets number and the packet content are specified.
- In the upper part of the Step 2, the ICMP Echo Request data size can be defined (up to 65535 bytes).
- The lower part of Step 2 allows the definition of the replies timeout.
- In Step 3 you can define the mean packet throughput.

Note: more information about these three areas is available in paragraph 10.4.1.3

For the “Sender – Traffic + Statistics” tab, four statistics are available when using ICMP Echo Request:

- Tx packets: this value represents the number of ICMP Echo Request packets sent.
- Rx packets: this value is the number of ICMP Echo Reply packets received.
- RTT: this value shows the mean Round Trip Time.
- Seq. Num. Errors (Sequence Numbering Errors): this value represents the number of replies that “LanTraffic V2” does not receive.

10.4.1.5 Configure the Automatic Mode

The Automatic Mode is a mode in which all enabled connections are generated together following a “Starting time connections generation” law and a “Data volume to send” law.

As the unitary testing mode, the automatic testing mode is configured in Tab 1 “Sender – Parameters” and run in Tab 2 “Sender Traffic +Statistics”.

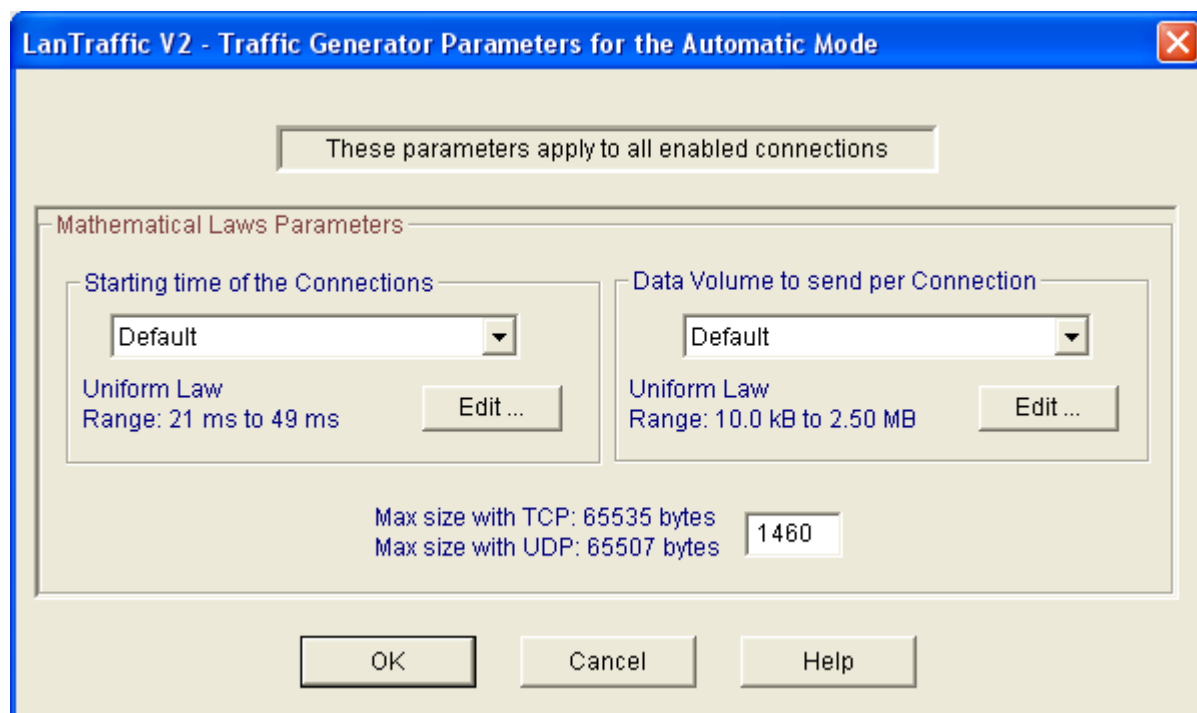

Once the automatic mode is selected in Tab 1, you can choose to enable or disable each connection by using the ON/OFF list box.

The screenshot shows the LanTraffic V2 application window. The 'Sender - Parameters' tab is active. It features a table with 16 connections, each with a destination IP (192.168.0.35), a protocol (UDP or TCP), and a port (ranging from 2009 to 2024). To the right of the table is a 'Save the Received Data' section with a 'Filename' field and 16 'Browse' buttons. Further right is the 'Traffic Generator' section, which has two radio buttons: 'Unitary Mode' and 'Automatic Mode'. The 'Automatic Mode' is selected. Below these radio buttons is a column of 16 'On' buttons, each corresponding to a connection. A bracket on the right side of these buttons is labeled '[P]'. At the bottom of the window, there are two sections for statistics: 'Sender Statistics' and 'Receiver Statistics', each with fields for 'Active Connections', 'Total Sending Throughput', and 'Total Receiving Throughput'. There are also buttons for 'Start Sender and Receiver' and 'Stop Sender and Receiver'.

By clicking on the '[P]' button (P as Parameters), the following window is displayed allowing to configure the automatic testing mode parameters:

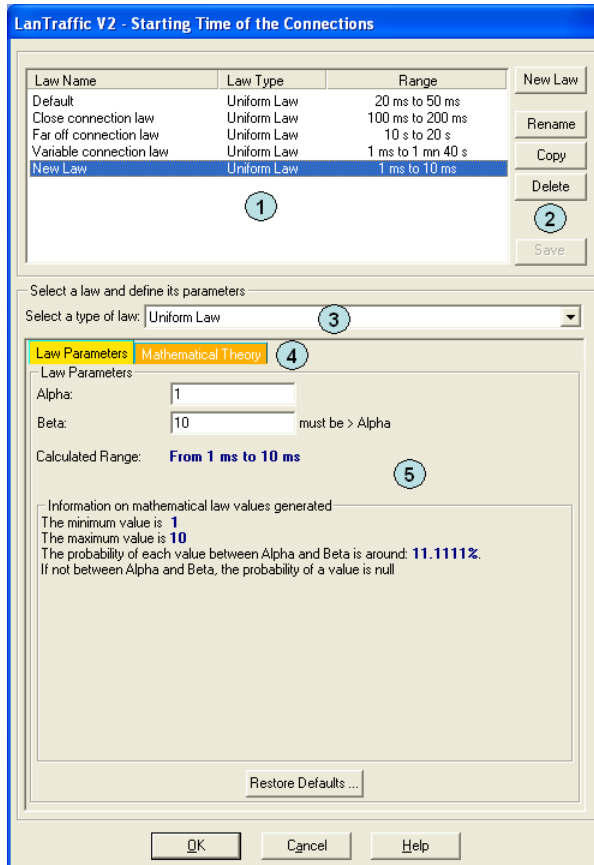

ICMP and SCTP can't be used with the Automatic Mode. In that case, the ICMP or SCTP connections are not started.

Automatic testing parameters window

10.4.1.5.1 Starting time connections generation laws

Starting time connection laws regulate the timing between the start of two connections. The available mathematical laws for starting time connection are Uniform and Exponential laws. (Mathematical laws are presented in details in Appendix part). You can add, modify, rename or delete a law by pressing the “Edit” button. Then a new window is displayed:

Starting time connections generation law window

- (1) The '**Law List**' area displays the list a existing law identified by the Law Name, the Law Type (one of the 4 mathematical laws) and the range of values. The Law Name is an editable area used to change the name of the law. To change the Law Name, you click in the list on the name you want to change or you use the **Rename** button.
- (2) There are 5 buttons to modify the list of laws :
 - **New Law:** This button should be used to create a new law (see below for more details).
 - **Rename:** This button is used to change the law name like when you click on the law name.
 - **Copy:** This button increases the way to create a law from an existing one.
 - **Delete:** This button should be used to delete an existing law. You should confirm the deletion.
 - **Save:** This button should be used to save any modification in the law list.
- (3) The '**Type of Law**' area displays the 4 mathematical laws. It should be used to select the law type of the Law. When the Law Type changes, the law parameters may be checked against an unexpected range of values.
- (4) The '**Law Parameters**' or '**Mathematical Theory**' tabs display either the parameters of the law or the related Mathematical Theory of the current selected law. The number of parameters and the Mathematical Theory depend on the selected type of law. The next figure illustrate the Pareto law Mathematical Theory:

(See Appendix 14.1 Mathematical laws used by LanTraffic V2 for more details about Mathematical laws).

- (5) The '**Law Parameters**' area allows entering values of the law. Depending on the law, the parameters and the user help regarding specific statistical values change, as shown below:

- Uniform Law:

Law Parameters

Alpha:

Beta: must be > Alpha

Calculated Range: **From 1 ms to 10 ms**

Information on mathematical law values generated

The minimum value is **1**

The maximum value is **10**

The probability of each value between Alpha and Beta is around: **11.1111%**

If not between Alpha and Beta, the probability of a value is null

- Exponential Law:

Law Parameters

Lambda: must be > 0

Calculated Range: **From 0 ms to 221 ms**

Information on mathematical law values generated

The minimum value is: **0**

The maximum value is: **221**

% of generated values are sitted after the value: **99**

The probability of the integer value (> 0) is around: **9.0484%**

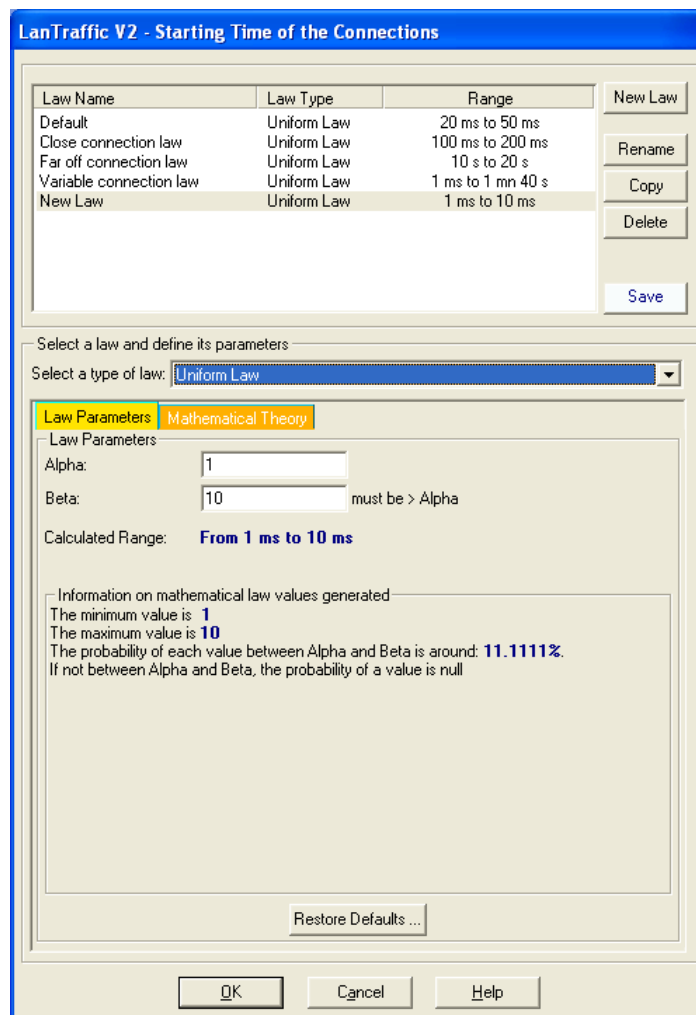

For a cumulative frequency:

from 0 to (integer > 0) equal to % you should choose a
lambda equal to: **0.0100503**

from (integer > 0) to infinity equal to % you should choose a
lambda equal to: **4.6051702**

To add a new *Starting time connections generation law*:

- 1) Press the “New Law” button, then a new Law List Entry is created, with the ‘Uniform Law’ as default Law Type :

Edit starting time connections generation law window

- 2) Rename the Law by using the Rename button or by editing the Law Name
- 3) Select the requested mathematical Law Type: Uniform, Exponential.
- 4) Enter parameters value for the selected mathematical law (1 or 2 parameters are required depending on the selected law),
- 5) Repeat operation 1 to 4 to create other laws.
- 6) Press the ‘Save’ button to register changes. Your last law is selected in the parent window when you press the OK button.

Note that the **Default** law can't be changed.

10.4.1.5.2 Data volume to send laws

Data volume laws regulate the data volume to send for connection. The available mathematical laws for data volume to send are: Uniform, Exponential, Pareto and Gauss laws. (Mathematical laws are presented in details in Appendix paragraph 14.1). You can add, modify, rename or delete a law by pressing the “Edit” button. Then the Data Volume Laws windows appear, as following:

LanTraffic V2 - Data Volume to send

Law Name	Law Type	Range
Default	Uniform Law	10.0 kB to 2.50 MB
Small volume	Uniform Law	5.00 MB to 10.0 MB
High volume	Uniform Law	110 MB to 1.05 GB
Variable	Uniform Law	11.0 MB to 950 GB

Buttons: New Law, Rename, Copy, Delete, Save

Select a law and define its parameters

Select a type of law: Uniform Law

Law Parameters | Mathematical Theory

Law Parameters

Alpha: 10000

Beta: 2500000 must be > Alpha

Calculated Range: **From 10.0 kB to 2.50 MB**

Information on mathematical law values generated

The minimum value is **10000**

The maximum value is **2.5e+006**

The probability of each value between Alpha and Beta is around: **< 0.0001%**

If not between Alpha and Beta, the probability of a value is null

Buttons: OK, Cancel, Help, Restore Defaults ...

Volume law window

Note that the **Default** law can't be changed.

To add a new data volume to send law:

1. Press the “New Law” button, then a new Law List Entry is created, with the ‘Uniform Law’ as default Law Type :

Edit data volume law window

2. Rename the Law by using the Rename button or by editing the Law Name
3. Select the requested mathematical Law Type: Exponential, Uniform, Pareto or Gauss.
4. Enter parameters value for the selected mathematical law (1 or 2 parameters are required depending on the selected law),
5. Repeat operation 1 to 4 to create other laws.
6. Press the ‘Save’ button to register changes. Your last law is selected in the parent window when you press the OK button.

According to the operating system used, the WinSock 2 interface could present number-limits of the incoming simultaneous calls. Consequence for LanTraffic V2 is the presence of “connection failed”, particularly when the connections frequency is very near (inferior to 150 ms), and when the data volume to transmit is very small which implies to make many connections.

These connection failures do not disturb “LanTraffic V2”. To reduce these failures, decrease the frequency of connections or increase the data volume.

10.4.1.5.3 Packet Size

In the automatic testing mode, entering a value in bytes in the "Mathematical Laws Parameters" window configures the packet size. Packet size is limited to 65,535 bytes for TCP. For UDP, it is limited to 65,507 bytes.

10.4.2 Sender - Traffic + Statistics tab

This second tab related to the Sender allows:

- Displaying destination parameters of each connection,
- Displaying traffic statistics for each connection,
- Starting and stopping each connection if the unitary testing mode is selected.
- Starting and stopping all enabled connections if the automatic testing mode is selected.

The cursor can be changed to the hourglass during the time needed to this tab to process IP address translation.

The Tab 2 “Sender - Traffic + Statistics” is divided in four areas:

- Destination Parameters
- Statistics (based on application data)
- Buttons to start/stop connections in the Unitary or Automatic mode selected in the “Sender – Parameters” tab
- Export statistics into a File

Each area is presented in the following paragraphs.

Sender - Parameters Sender - Traffic + Statistics Receiver - Traffic + Statistics Throughput Graphics								
Destination Parameters			Statistics (based on application data)					
	IP Address or Host Name	Port	Tx Throughput	Tx Volume	Tx Packets	Rx Throughput	Rx Volume	Rx Packets

Choose Columns Reset Display

Tab 2: “Sender - Traffic + Statistics”

10.4.2.1 Destination Parameters

In this area, the destination parameters (IP address and port number) are displayed as information for each connection. These parameters can be modified in the tab 1 “Sender – Parameters” if the connection is stopped.

10.4.2.2 Sender Statistics

By using the "Choose Columns" button at the bottom, you can select the parameters to display.

Up to 7 parameters can be simultaneously displayed among 13 parameters described later in this paragraph, and at least one parameter must be selected.

These statistics are calculated at the application level (and based on application data sent or received). No MAC, IP and SCTP/TCP/UDP headers and trailers are taken into account.

To reset the statistics displayed, two methods can be used:

- by clicking on the "Reset Display" button (this button is enabled when all connections are stopped).
- by checking the "Clear on Stop" option (when the connection stops, the statistics for this connection are automatically cleared).

The "**N/A**" (Not Applicable) mention can be displayed instead of a value in the cell of the statistics table if the parameter cannot be calculated.

Statistics (based on application data)						<input type="checkbox"/> Clear on Stop
Tx Packets	Tx Throughput	Rx Packets	Rx Throughput	Jitter	Seq. Num. Errors	
Connection failed: no response from the Remote. Please check your parameters.						
4817 p	2.23 Mb/s	0 p	0.00 b/s	N/A	N/A	

If a connection is in progress or cannot be activated (in case of invalid parameters or connection problem), a warning message is displayed.

Examples:

- Connection failed: no response from the Remote. Please check your parameters.
- Connection pending: LanTrafficV2 is waiting for the Remote response.
- Connection reset: the Remote has reset the connection.

Statistics (based on application data)						<input checked="" type="checkbox"/> Clear on Stop
Tx Packets	Tx Throughput	Tx Volume	Rx Packets	Rx Throughput	Jitter	Seq. Num. Errors
Connection failed: no response from the Remote. Please check your parameters.						
Connection reset: the Remote has reset this connection.						

Note: the warning message isn't deleted even if the "Clear on Stop" option is selected.

List of the 13 statistic parameters calculated for the Sender***Sending statistics*****Tx Packets**

Tx Packets (Tx = Transmit) is the number of packets that LanTraffic V2 has sent since the connection is started. This value isn't available with TCP connections.

Tx Pkts Throughput⁽²⁾

Tx Pkts Throughput (Tx = Transmit) is the mean number of packets that LanTraffic V2 is sending per second. This value is only available with UDP connections.

Tx Throughput⁽²⁾

The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.

Tx Throughput (Tx = Transmit) is the mean throughput of data sent. The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.

Tx Volume⁽²⁾

Tx Volume (Tx = Transmit) is the number of bytes that **LanTraffic V2** has sent since the connection is started.

Receiving statistics**Rx Packets⁽¹⁾**

Rx Packets (Rx = Receive) is the number of packets that **LanTraffic V2** has received since the connection is started. This value is only available with UDP connections.

Rx Pkts Throughput^{(1) (2)}

Rx Pkts Throughput (Rx = Receive) is the mean number of packets that **LanTraffic V2** is receiving per second. This value is only available with UDP connections.

Rx Throughput^{(1) (2)}

The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.

Rx Throughput (Rx = Receive) is the mean throughput of data received. The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.

Rx Volume^{(1) (2)}

Rx Volume (Rx = Receive) is the number of bytes that **LanTraffic V2** has received since the connection is started.

Other statistics**Jitter⁽¹⁾⁽²⁾**

Jitter is the mean variation of delays on packets received. This value is only available when RTT option is selected (on the Local Sender: see Traffic Generator Parameters). This value corresponds to either the one-way variation mean (remote Receiver = Generator mode) or the two-ways variation mean (remote Receiver = Echoer mode). (Not available with SCTP)

Remaining Volume⁽²⁾

'Remaining Volume' is the number of bytes that **LanTraffic V2** has still not sent yet. This information is only available for two Traffic Generator types (Mathematical Law and File to Send).

RTT⁽¹⁾

'RTT' is the Round Trip Time of a packet that was sent by **LanTraffic V2**. This value is calculated if the RTT option is selected on the local Sender Traffic Generator and if the remote Receiver works in Echoer mode. (Not available with SCTP)

Seq. Numb. Errors⁽¹⁾

'Seq. Numb. Errors' (Sequence Numbering Errors) is the sum of the Out Of Sequence packets number (OOS) and the number of lost packets. This value is only available if the RTT option is selected (on local Sender: see Traffic Generator Parameters) and if the working mode of the remote Receiver is Generator or Echoer. (Not available with TCP or SCTP)

Volume To Send⁽²⁾

'Volume To Send' is the number of bytes that **LanTraffic V2** should send. This information is available for two Traffic Generator Types only (Mathematical law and File to Send).

⁽¹⁾ These statistics are not available with SCTP

⁽²⁾ These statistics are not available with ICMP

10.4.2.3 Export Statistics into a File

To export all or part of **statistics** into a file, click on the 'Parameters' button when enabled (i.e. if connections of the Sender are not active):

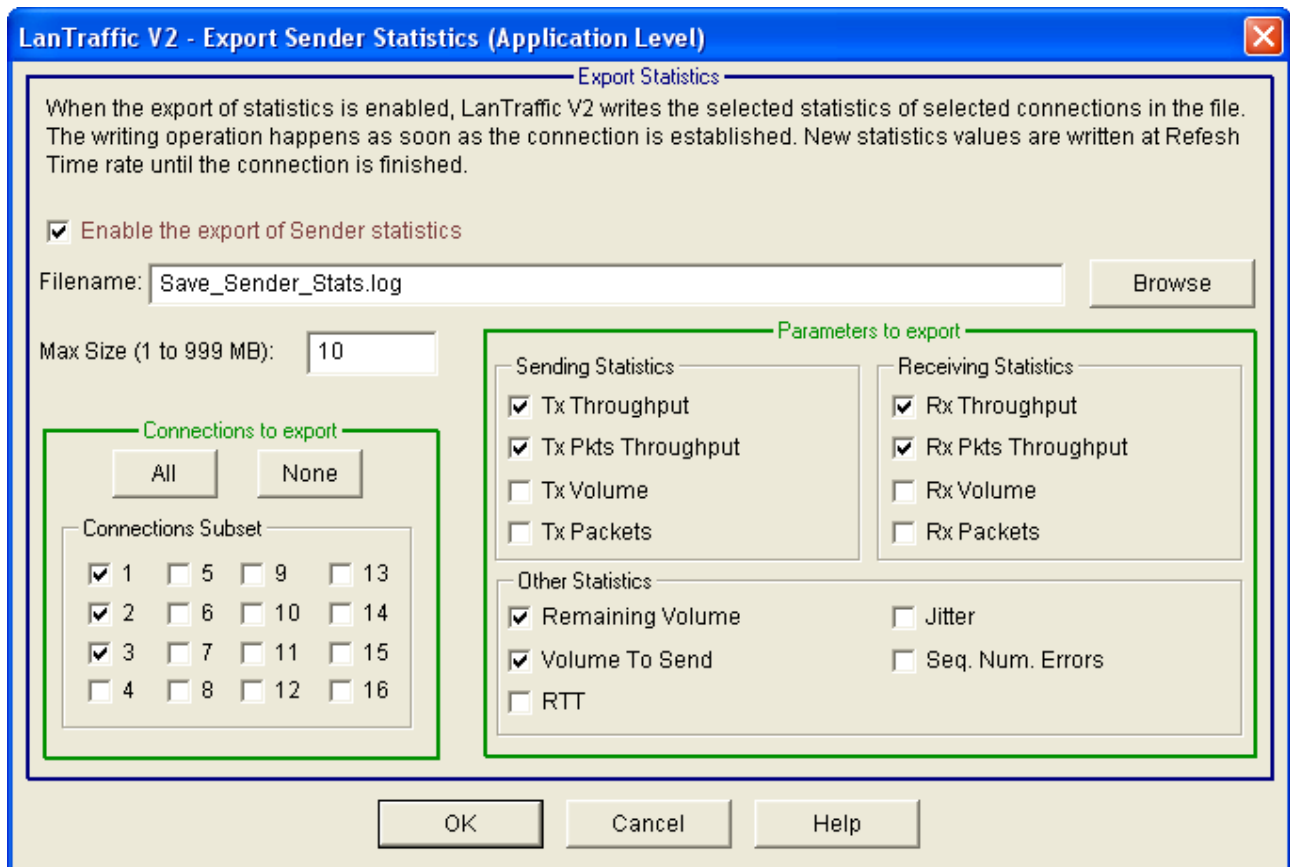

When no parameters are defined, the state is:

Export is disabled

Then a new window allows defining parameters for the export process:

- Enable or disable the export process,
- The filename (.log extension) of the export file,
- The maximum size of the export file (*when the maximum size of the file is reached, statistics are not saved anymore*),
- The identification of the needed connections,
- The parameters to export (up to 13).

Then press OK to validate, and a new state is displayed:

When parameters have been defined and the export process is enabled, the state is:

Export is enabled

Do not specify the same filename to save statistics for the Sender and the Receiver parts; If you do so, a warning message is displayed.

The statistics file is updated with the same refresh period than the statistics displayed. A special mark is added to keep special TCP, UDP, ICMP or SCTP events e.g. Begin and End of sending traffic. When you reset statistics, the displayed values and the exported values are reset. Statistics are saved into the file as soon as the connections of the Sender are started and the 'Export is running' state is displayed:

When all connections are stopped, then the export process is automatically suspended and the following idle state is displayed:

10.4.2.3.1 Sender statistics file format

The Sender statistics file is formatted line by line as follows. The data delimiter is the tab.

First line: Starting session MM/DD/YYYY at HH:MM:SS,mmm (**UTC time**)

Second line: LanTrafficV2 Sender

Third line: contains the labels of columns

Connection #nn (Protocol)	Date	Time	Parameter i	Parameter j	Parameter ...
---------------------------	------	------	-------------	-------------	---------------

with:

- nn is the number of the connection
- Protocol is UDP or TCP,
- Date (MM/DD/YYYY)
- Time (HH:MM:SS.mmm) **UTC time**
- Parameter i, Parameter j ... are the statistics chosen by the user (up to 13 parameters can be selected)
Example: Parameter i = Tx (Transmit) Throughput, Parameter j = Tx (Transmit) Packets ...

Next lines: numerical values

Connection #nn (Protocol)	MM/DD/YYYY	HH:MM:SS.mmm	nnn.nn	nnn.nn	...
---------------------------	------------	--------------	--------	--------	-----

Additional marks for TCP, UDP, SCTP and ICMP connection events

Connection #nn (TCP or UDP or SCTP or ICMP) START: This indicates the beginning of sending traffic for the connection #nn (nn: from 01 to 16). Numerical values are latest values computed by **LanTraffic V2** for the line.

Connection #nn (TCP or UDP or SCTP or ICMP) END: This indicates the end of traffic for the connection #nn. Numerical values are latest values computed by **LanTraffic V2** for the line.

Additional mark for TCP, UDP, ICMP or SCTP disconnection events

Connection Cnx #n (TCP or UDP or SCTP or ICMP) ERROR: This mark indicates the reason of the disconnection if this one is not produced by the click on the stop button or the scheduled end of the traffic generation (due to the generator parameters, for example: Number packets to send = 1000). When this mark is included in the Sender traces, the numerical values are replaced by the error message returned by **LanTraffic V2**.

Idle connections

When the connection is idle, the numerical values are set to 0 for "Tx Throughput", "Rx Throughput", "Tx Volume", "Rx Volume", "Tx Packets" and "Rx Packets" columns.

Conventions

"Volume to send" and "Remaining Volume" are filled with the "N/A" symbol when the generator is not configured with "File to send".

"Seq. Num. Errors", "Jitter" and "RTT" are filled with the "N/A" symbol until one "RTT" header is found in the received data by the Sender part.

"Tx Packets", "Rx Packets", "Tx Pkts Throughput" and "Rx Pkts Throughput" are filled with the "N/A" symbol when the protocol used for the concerned connection is not UDP.

When a connection is using ICMP protocol, all statistics are filled with the "N/A" symbol, except "RTT", "Seq. Num. Errors", "Tx Packets" and "Rx Packets".

When a connection is using SCTP protocol, some statistics are filled with the "N/A" symbol : "RTT", "Seq. Num. Errors", "Rx Packets", "Rx Volume", "Jitter", "Rx Pkts Throughput" and "Rx Throughput".

10.4.2.3.2 Export Sender file sample

In the following example, 3 connections (#01, #02 and #16) have been selected for the local Sender with 8 parameters exported: Tx (Transmit) Packets, Tx (Transmit) Throughput, Tx (Transmit) Volume, Rx (Receive) Packets, Rx (Receive) Throughput, Rx (Receive) Volume, RTT and Seq. Num. Errors (Sequence Numbering errors):

- Connection #01: Protocol = UDP & Traffic Generator type = Packets generator [Size Packet = 1460, Inter Packet Delay = 20, RTT option = No, Number of packets=10000]
- Connection #02: Protocol = TCP & Traffic Generator type = Packets generator [Size Packet = 1460, Inter Packet Delay = 20, RTT option = Yes, Number of packets=10000]
- Connection #16: Protocol = TCP & Traffic Generator type = Packets generator [Size Packet = 1460, Inter Packet Delay = 20, RTT option = Yes, Number of packets=10000]

The remote Receiver has been configured with 3 enabled connections working in the following modes:

- Connection #01: working mode = Absorber
- Connection #02: working mode = Echoer
- Connection #03: working mode = Absorber

Parameters set in the General Parameters of the Configuration menu:

- Refresh time = 2 seconds
- Throughput sampling period = 5 seconds
- Unit = kilobytes (kB) & kilobits per second (kb/s)

The 3 connections are started all together; and then the connections #01, #02 and #16 are stopped manually.

10.4.2.4 Run the Unitary Mode

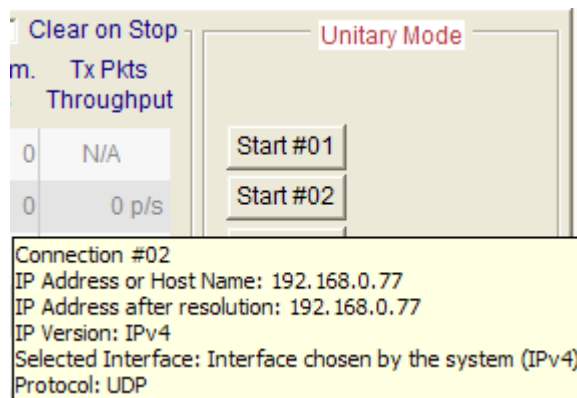

The unitary mode is chosen in the "Sender – Parameters" tab. The unitary testing mode can be launched from the **Unitary Mode** area as shown on the left side.

You can run or stop connections separately (by using the command buttons 'Start #nn' or 'Stop #nn'), or all together ('Start All Connections' or 'Stop All Connections').

Tooltip to get a summary of connection parameters:

You can view a summary of the main parameters of a connection when moving the mouse over the 'Start #nn' button, then a tooltip is displayed:

Tab 2 "Sender - Traffic + Statistics" – Connection summary

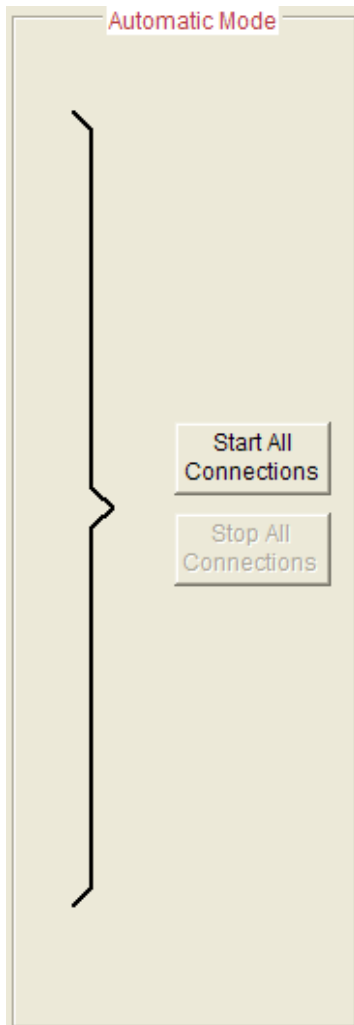

The "Sender – Traffic + Statistics" summary tooltip displays:

- The connection number
- The IP address or Host Name entered by the user
- The IP address in numerical format after resolution
- The IP version
- The interface used
- The protocol selected.

To carry out the unitary testing session:

1. In Tab 2: "Sender Traffic + Statistics"
 - ⇒ If the Sender connections are active, stop all running connections by pressing the "Stop All Connections" button.
2. In Tab 1: "Sender Parameters"
 - ⇒ Select the Unitary Mode.
3. In Tab 1: "Sender Parameters"
 - ⇒ If necessary configure the unitary parameters of each connection by pressing the "Parameters #n" button.
4. In Tab 2: "Sender Traffic + Statistics"
 - ⇒ Press the "Start all Connections" button to start all connections together or press the "Start #nn" buttons to start connections one by one.

10.4.2.5 Run the Automatic Mode

The Automatic mode is chosen in the "Sender – Parameters" tab.

The automatic testing mode can be launched from the **Automatic Mode** area as shown on the left.

In this area, there are two buttons to start and stop all enabled connections: 'Start All Connections' and 'Stop All Connections'.

To carry out the automatic testing session:

- 1 *In Tab 2: "Sender - Traffic + Statistics"*
 - ⇒ If the Sender connections are active, stop all running connections by pressing the "Stop All Connections" button.
- 2 *In Tab 1: "Sender - Parameters"*
 - ⇒ Select the Automatic Mode.
- 3 *In Tab 1 "Sender - Parameters":*
 - ⇒ If necessary, configure the automatic parameters by pressing the "[P]" button and enable or disable connections by using the ON/OFF combo box.
- 4 *In Tab 2: "Sender - Traffic + Statistics":*
 - ⇒ Press the "Start All Connections" button to start all enabled connections.

10.5 The Receiver part

The Receiver part allows receiving UDP, TCP or SCTP traffic following five different working modes: 'Absorber' or 'Absorber File', 'Echoer' or 'Echoer file', and 'Generator', except for SCTP where 'Absorber' and 'Absorber File' mode are allowed only.

Receiver - Parameter + Statistics tab

By using this tab, you can:

- Configure up to 16 connections in order to receive some traffic from one or several remote Senders,
- Configure the receiving working mode for each connection,
- Select the statistics to display (5 among 13 parameters) and save it into a file.

The tab is divided in four areas: 'Listening To ...', 'Coming From ...', receiving 'Working Mode' and 'Statistics'.

Listening To ...			Coming From ...	Working Mode	Statistics (based on application data)				
	Port	Protocol	Remote IP Address or Host Name		Rx Throughput	Rx Volume	Tx Throughput	Tx Volume	Jitter
Connection #01	2009	TCP	ANY_ADDRESS	Absorber					
Connection #02	2009	TCP	ANY_ADDRESS	Absorber					
Connection #03	2009	TCP	ANY_ADDRESS	Absorber					
Connection #04	2009	TCP	ANY_ADDRESS	Absorber					
Connection #05	2009	TCP	ANY_ADDRESS	Absorber					
Connection #06	2009	TCP	ANY_ADDRESS	Absorber					
Connection #07	2009	TCP	ANY_ADDRESS	Absorber					
Connection #08	2009	TCP	ANY_ADDRESS	Absorber					
Connection #09	2009	TCP	ANY_ADDRESS	Absorber					
Connection #10	2009	TCP	ANY_ADDRESS	Absorber					
Connection #11	2009	TCP	ANY_ADDRESS	Absorber					
Connection #12	2009	TCP	ANY_ADDRESS	Absorber					
Connection #13	2009	TCP	ANY_ADDRESS	Absorber					
Connection #14	2009	TCP	ANY_ADDRESS	Absorber					
Connection #15	2009	TCP	ANY_ADDRESS	Absorber					
Connection #16	2009	TCP	ANY_ADDRESS	Absorber					

Export Statistics into a File: Parameters | Export is disabled

Start Receiving Traffic | Stop Receiving Traffic

Choose Columns | Reset Display

Tab 3 "Receiver - Traffic + Statistics"

10.5.1 Duplicate parameters of a connection onto others

In order to facilitate input of the parameters for a connection, a *copy/paste function* for all parameters of a connection is available (identical to the *copy/paste function* for the Sender part – see 10.4.1.1.4).

This function is not available when the canonical IP address cannot be translated in numerical format.

Duplication of connection parameters doesn't copy the interface information. When you copy a connection to another one, the IP address translation function is started.

10.5.2 Listening To ...

In this area, you configure each receiving connection with the following parameters corresponding to the connected sender from which connections are received:

Network interface selection and IP version *

- The black arrow has two purposes:*
- To display a summary of the connection parameters
 - To select the network interface and the IP version for a connection.

Port

The port number is limited to 65,535.
By default, the entered port number is 2009.
In case of invalid value, the value becomes **red**.

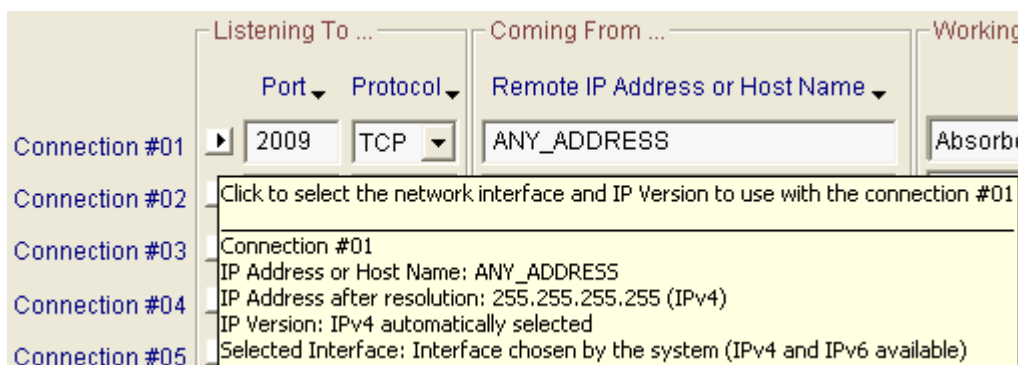

Protocol

TCP or UDP or SCTP protocol (default = TCP protocol).

* Not available with SCTP protocol

10.5.2.1 Summary of the connection parameters

When you move the mouse over the black arrow, a popup window - called a **tooltip**, is displayed.

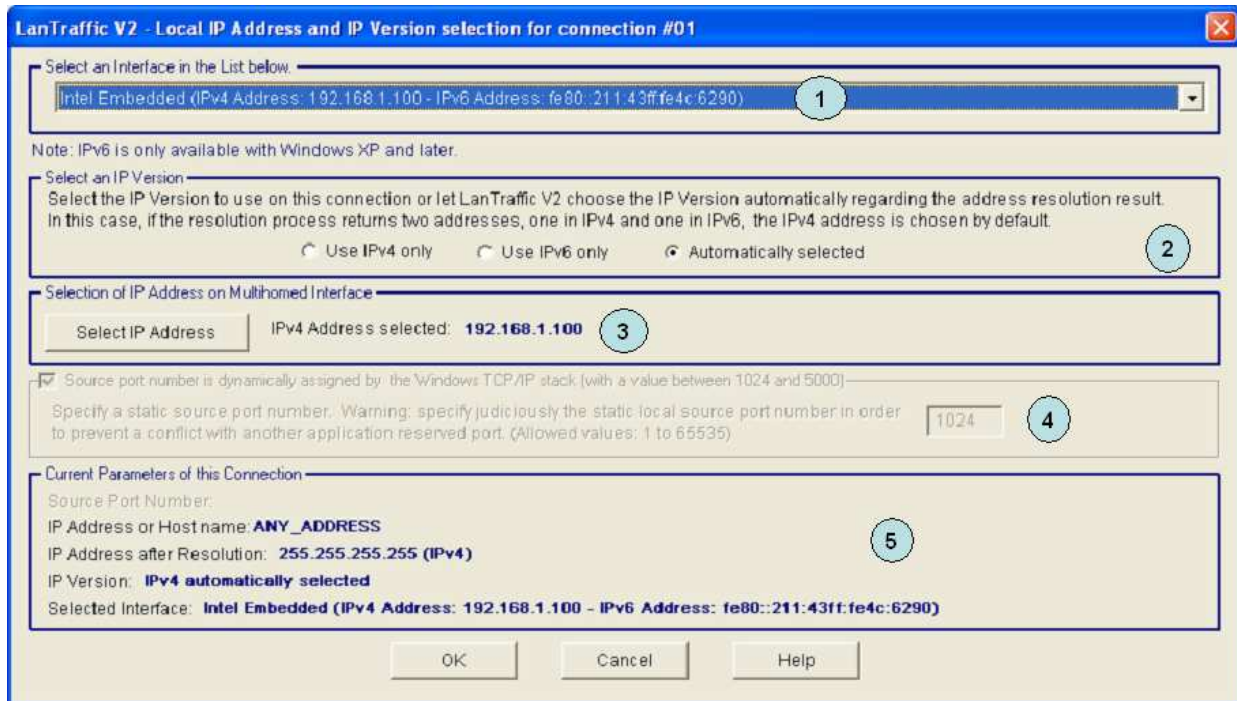

Receiver connection tooltip

The tooltip for the Receiver connection includes 5 items:

- The first item is the connection number the tooltip refers to.
- The next item is the IP address or Host Name defined by the user.
- The next item is the IP address translated when IP Translation address has succeeded (e.g. the address is not NO_ADDRESS or 0.0.0.0).
- The next item is the IP version currently selected.
- The last item is the interface name selected. The name displayed is the name of the connection presented in the "Settings/Network and Dial-up Connections" Start menu of the operating system (Default is "Interface chosen by the system").

10.5.2.2 Select the network interface, IP version and local IP address (except for SCTP)

When you click on the black arrow, the following window is displayed:

Network interface, IP version and IP local address for a Receiver connection

(1) The **network interface** selection is optional. It is used to select the IPv6 or to force connections to be established using a specific interface.

- By default:
 - The IP version is automatically selected by **LanTraffic V2** regarding the destination address or host name specified on the “Receiver –Traffic + Statistics” tab (see below). By default, NO_ADDRESS is an IPv4 address.
 - The IP stack resolves the interface selection to send packets to the remote. The IP stack uses the destination IP address to select the correct interface. IP address and netmask related to each interface are checked against the remote IP address to reach. When an interface that matches the remote IP address is found, it is used. To understand how the IP stack selects the interface, you may enter ‘route print’ console command to list the interface order, the IP address and the network address mask.
- You can select one interface from the list of connected interfaces. **LanTraffic V2** will only use the selected interface to translate the IP address and to make a connection. You must select the interface compatible with the remote IP address you want to reach. When the IP address translation failed, current connection parameters area is updated as follows:

- Interface types are restricted: only Ethernet and PPP are listed. A PPP interface should be in the connected state to belong to the interface list.

- (2) The **IP version** selection is available:
- with all Windows, from Windows XP
 - with Windows XP or Server 2003, if IPv6 features are not installed on the target machine, please refer to the Windows XP documentation to install the IPv6 stack.
 - you can allow **LanTraffic V2** to choose automatically the good IP version regarding the address or host name resolution result. If a canonical name corresponds at the same time to an IPv4 and IPv6 addresses, **LanTraffic V2** chooses the IPv4 address. In this case, to use the IPv6 address, you should select the use of IPv6 only (*Use IPv6 only*).

If you have selected an IP version, the IP address translation (see 10.4.1.1.3) uses the current selected IP version to get the IP address numerical form.

- (3) **Select IP address** is available when multiple IP addresses are attached to the network interface. This interface configuration is also known as 'multihomed' interface. The selection of a Source IP address is generally not required: **LanTraffic V2** uses the default IP address of the interface to establish connections. It may be useful when routing priority or policy is defined. Example of an IP address selection for a multihomed interface:

Select IP address is not available if the default interface 'Interface chosen by the system' is selected.

- (4) **Specification of the local source port number** is disabled in the receiver Interface configuration because the source port number and the destination port number are generated by the remote as the originator of the connection.
- (5) **Current parameters of this connection** area are an abstract for the connection. It summarizes the IP address, the numerical IP address format, the IP version and the interface selection.
- The source port used is dynamically updated with the user selection.
 - The IP addresses are static. The IP address translation will process only when you click on OK.
 - The IP version field is dynamically updated with the user selection.
 - The current interface is dynamically updated with the user selection.

When you click on the OK button, if the interface selected or IP version has changed, the IP address translation is automatically started. [It may be time consuming.](#)

So, you can configure various incoming connection criteria:

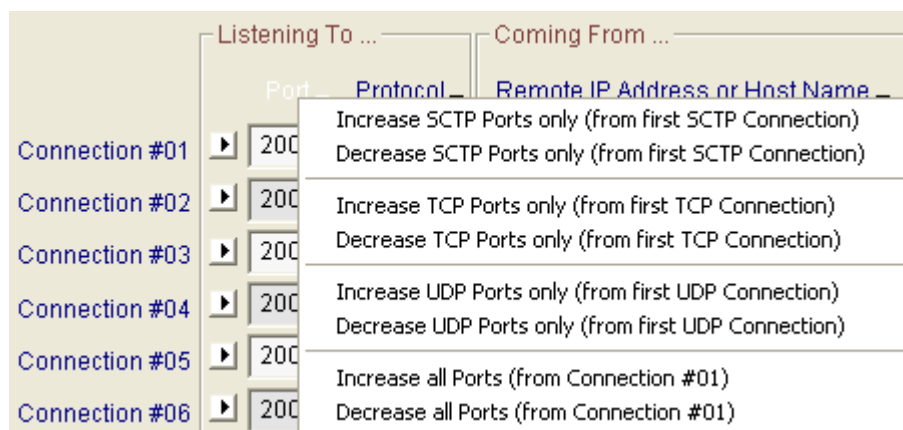

- **Interface:** you limit a connection to a specific Interface or let the Operating System to return connections from any interfaces.
- **IP version:** when an Interface offers the two IP versions, you can select the IP version expected or not. By default, the automatic selection is activated.
- **When multiple IP addresses are attached to one interface,** you should select the destination IP address the incoming connection should refer to. By default, the first IP address returned by the system is selected.

10.5.2.3 Port floating menu

When the mouse is located on the 'Port' text area, the color changes to white and the following tooltip is displayed:

Click on the left mouse button to display the four items menu as following:

With this menu, you can:

- Set the port number increasingly or decreasingly for all Sctp connections, based on the port number of the first Sctp connection,
- Set the port number increasingly or decreasingly for all TCP connections, based on the port number of the first TCP connection,
- Set the port number increasingly or decreasingly for all UDP connections, based on the port number of the first UDP connection,
- Set the port number increasingly or decreasingly for all connections, based on the port number of the first connection without taking into account the protocol in use.

10.5.2.4 Protocol floating menu

When the mouse is located on the 'Protocol' text area, the color changes to white and the following tooltip is displayed:

Click on the left mouse button to display the short menu as below:

This menu helps to set the same protocol for all connections.

10.5.3 Coming From ...

Remote IP address or Host Name: *Enter the IP address (numerical format) or Host Name (canonical format), with the help of AutoComplete when active.*

By default, the value is ANY_ADDRESS (This address is a mask to accept connection from any source address. It applies on both IPv4 and IPv6).

10.5.3.1 IP address floating menu

When the mouse is located on the 'IP address' text area, the color changes to white and the following tooltip is displayed:

Click on the left mouse button to display the short menu as below:

With this function, the IP Address field from connection #01 is copied out on all connections from #02 to #16.

10.5.3.2 IP Address translation mechanism

LanTraffic V2 tries to translate – e.g. to resolve - the IP address from a canonical to a numerical format. This operation is called the *IP address translation mechanism*. When the 'IP Address or Host Name' field or Interface parameters changes, when you move from 'IP Address or Host Name' field to another field, to another tab, when the Enter key is pressed or when the Interface parameters change, all of these actions start the IP address translation function.

Because the IP address translation mechanism is CPU consuming, you should be careful when using IP canonical addresses. CPU consumption depends on the DNS answer speed, the number of DNS configured and the network load when the DNS request is sent.

If the network environment changes – e.g. a new DNS has been defined - you should press the Enter key in the 'IP Address or Host Name' field to force **LanTraffic V2** to restart the translation mechanism for this connection.

When the IP address translation failed, the IP address is written in red on a white background. This connection cannot be started: the "Run" button in the 'Sender – Traffic + Statistics' tab is grayed.

*To summarize, the **IP address translation** mechanism is activated when:*

- *the focus leaves the 'IP Address or Host Name' field,*
- *another tab is selected,*
- *you duplicate parameters from one connection to another,*
- *you change the Interface parameters,*
- *a context file is loaded.*

10.5.4 Working Mode

LanTraffic V2 offers five different active working modes for the Receiver part: 'Absorber', 'Absorber file', 'Echoer', 'Echoer File', 'Generator'. Only the two first modes are available with SCTP protocol. A 'Disable' (or inactive) mode is also available.

10.5.4.1 Absorber mode

With this working mode, data received by **LanTraffic V2** is used for statistics only.

10.5.4.2 Absorber File mode

When a receiving connection is operating in the Absorber File mode, the Receiver will save the received data in a file. The name of the file must be entered in the Filename field. A 'Browse' button allows selecting the file easily.

10.5.4.3 Echoer mode (with TCP and UDP only)

When a receiving connection is operating with the echoer mode, the received data are sent back to the Sender.

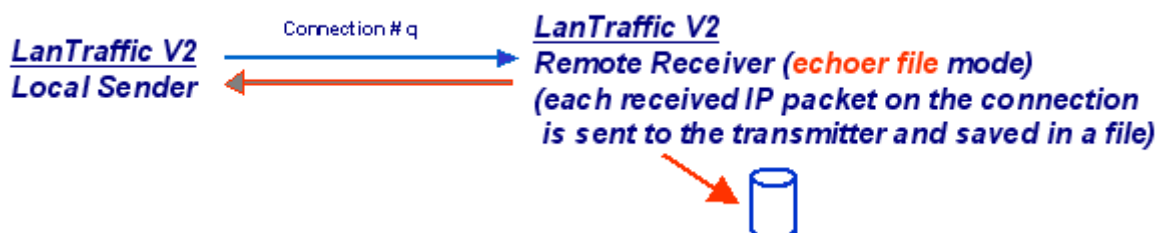

With UDP protocol, echoer mode is available only if a connected sender IP address is specified.

Echoed data can be saved into a file on the remote Sender via the "Sender - Parameters" tab.

10.5.4.4 Echoer File mode (with TCP and UDP only)

When a receiving connection is operating in this mode, the received data are sent back to the Sender and saved into a file. The name of the file must be entered in the Filename field. A 'Browse' button allows selecting the file easily.

10.5.4.5 Generator mode (with TCP and UDP only)

This mode is displayed as 'Generator' in the combo-box.

Properties of the *IP flow 1* are defined at the **LanTraffic V2** Local Sender level and each IP packet received by the remote Receiver module is used to compute statistics only.

	Port	Protocol	Remote IP Address or Host Name		
Connection #01	2009	TCP	ANY_ADDRESS	Absorber Gen	Param. #01

When you select the “Generator” mode for a connection (#01 in the example above), a 'Param.' Button is displayed in order to specify the traffic parameters generated by the 'Remote Receiver' entity (i.e. *IP flow 2*).

When the 'Param.' Button is pressed, a “LanTrafficV2 - Traffic generator parameters in unitary testing mode” window is displayed (the same as Sender part – configure unitary testing mode).

So you can input parameters you like for this *IP flow 2* (for example, generate 10,000 packets with a mean throughput of 250 Kbps).

For a TCP connection, *IP flow 2* is generated as soon as the TCP connection will be established between the 'Local Sender' and the 'Remote Receiver' modules. It stops when 'Local Sender' stops the connection or at the end of the 'Remote Receiver' Traffic generator.

For a UDP connection, *IP flow 2* is generated as soon as the 'Remote Receiver' receives the first UDP packet. It stops when the traffic from the 'Local Sender' is void during 5 seconds (default value) or at the end of the 'Remote Receiver' Traffic generator.

10.5.4.6 Disable mode

When this mode is selected for a connection, **LanTraffic V2** does not establish the connection. The disabled connections are grayed when you start generating traffic. Statistics fields of disabled connections are filled with the following message: “Connection has been disabled”.

10.5.5 Statistics

By using the "Choose Columns" button at the bottom, you can select the parameters to display.

Up to 5 parameters can be simultaneously displayed among 13 parameters described later in this paragraph, and at least one parameter must be selected.

These statistics are computed at the application level (and based on application data sent or received). No MAC, IP and TCP/UDP/SCTP headers and trailers are taken into account.

To reset the statistics displayed, you can use the 'Reset Display' button at any time.

The "**N/A**" (Not Applicable) mention can be displayed instead of a value in the cell of the statistics table if the parameter cannot be calculated.

Statistics (based on application data)				
Rx Packets	Rx Pkts Throughput	Rx Throughput	Jitter	Seq. Num. Errors
2769 p	47 p/s	536 Kb/s	N/A	N/A
1044 p	N/A	1.03 Mb/s	0 ms	0

If a problem is detected for a connection, a warning message is displayed.

Example:

- Problem: disconnection due to TCP inactivity (cf. registry). *The Receiver has ended the TCP connection because no data has been received (timeout defined with the TCPINACTIVITY parameter of **LanTraffic V2** in the registry).*

Statistics (based on application data)				
Rx Packets	Rx Pkts Throughput	Rx Throughput	Jitter	Seq. Num. Errors
524 p	46 p/s	525 Kb/s	N/A	N/A
Problem: disconnection due to TCP inactivity (cf registry).				

List of the 13 statistic parameters calculated for the Receiver

Sending statistics

Tx Packets ⁽¹⁾	Tx Packets (Tx = Transmit) is the number of packets that LanTraffic V2 has sent since the connection is started. This value is only available with UDP connections;
Tx Pkts Throughput ⁽¹⁾	Tx Pkts Throughput (Tx = Transmit) is the mean number of packets that LanTraffic V2 is sending per second. This value is only available with UDP connections. The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.
Tx Throughput ⁽¹⁾	Tx Throughput (Tx = Transmit) is the mean throughput of data sent. The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.
Tx Volume ⁽¹⁾	Tx Volume (Tx = Transmit) is the number of bytes that LanTraffic V2 has sent since the connection is started.

Receiving statistics

Rx Packets	Rx Packets (Rx = Receive) is the number of packets that LanTraffic V2 has received since the connection is started. (UDP only)
Rx Pkts Throughput	Rx Pkts Throughput (Rx = Receive) is the mean number of packets that LanTraffic V2 is receiving per second. This value is only available with UDP connections. The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.
Rx Throughput	Rx Throughput (Rx = Receive) is the mean throughput of data received. The calculation of this value is based on the sampling period defined by the throughput sampling period in the 'Configuration/General Parameters' menu.
Rx Volume	Rx Volume (Rx = Receive) is the number of bytes that LanTraffic V2 has received since the connection is started.

Other statistics

Data Not Echoed ⁽¹⁾	'Data Not Echoed' is the number of bytes that the Receiver couldn't echo. This value is only available if the Receiver works in the Echoer mode. (Not available with SCTP protocol)
Jitter	Jitter is the mean variation of delays on packets received. This value is only available when RTT option is selected (on the remote Sender: see Traffic Generator Parameters). This value corresponds to the one-way variation mean only.
Remaining Volume ⁽¹⁾	'Remaining Volume' is the number of bytes that LanTraffic V2 has still not sent yet. This information is only available for two Traffic Generator types (Mathematical Law and File to Send).
Seq. Numb. Errors	'Seq. Numb. Errors' (Sequence Numbering Errors) is the sum of the Out Of Sequence packets number (OOS) and the number of lost packets. This value is only available if the RTT option is selected (on local Sender: see Traffic Generator Parameters) and if the working mode of the remote Receiver is Generator or Echoer.
Volume To Send ⁽¹⁾	'Volume To Send' is the number of bytes that " LanTraffic V2 should send. This information is available for two Traffic Generator Types only (Mathematical law and File to Send).

⁽¹⁾ These statistics are not available with SCTP

By pressing the 'Start Receiving Traffic' button, all connected sender information and working mode information are grayed,
Disabled connections statistics fields are empty on gray background,
UDP enabled connections statistics fields are filled with "00" value on white background,
TCP connections statistics fields are empty on white background (they will be filled only when the connection is established).

By pressing the 'Stop Receiving Traffic' button, statistics fields are cleared up, connected sender and working mode parameters become available. ***This button also stops the Receiver statistics exported into a file.***

By pressing the 'Reset Display' button, the statistics displayed are reset. The Receiver statistics displayed can be reset at any time.

10.5.6 Export Statistics into a File

To export all or part of **statistics** into a file, click on the 'Parameters' button when enabled (i.e. if the Receiver is not active):

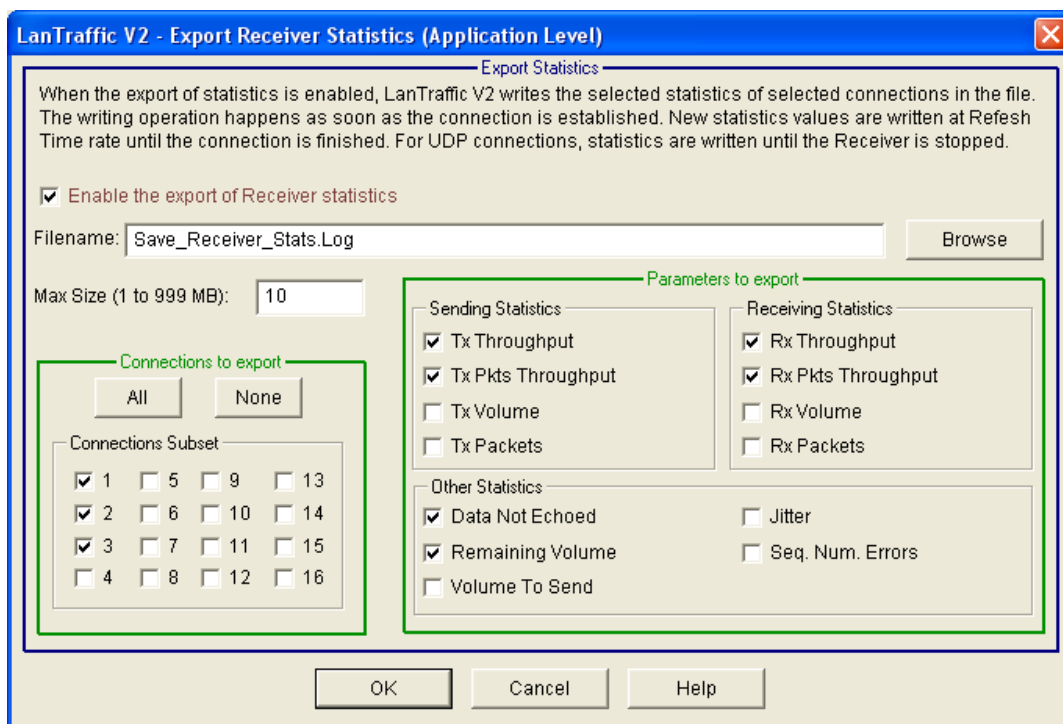

When no parameters are defined, the state is:

Export is disabled

Then a new window allows defining parameters for the export process:

- Enable or disable the export process,
- The filename (.log extension) of the export file,
- The maximum size of the export file (*when the maximum size of the file is reached, statistics are not saved anymore*),
- The identification of the needed connections,
- The parameters to export (up to 13).

Then press OK to validate, and a new state is displayed:

When parameters have been defined and the export process is enabled, the state is:

Export is enabled

Do not specify the same filename to save statistics for the Sender and the Receiver parts; if you do so, a warning message is displayed.

The statistics file is updated with the same refresh period than the statistics displayed. A special mark is added to keep special TCP, UDP or SCTP events e.g. Begin and End of sending traffic. When you reset statistics, the displayed values and the exported values are reset.

Statistics are saved into the file as soon as the 'Start Receiving Traffic' button of the Receiver has been pressed and the 'Export is running' state is displayed:

When the 'Start Receiving Traffic' button of the Receiver has been pressed, then the export process is automatically suspended and the following idle state is displayed:

10.5.6.1 Receiver statistics file format

The Receiver statistics file is formatted line by line as follows:

First line: Starting session MM/DD/YYYY at HH:MM:SS.mmm (**UTC time**)

Second line: LanTrafficV2 Receiver

Third line: this line contains the labels of columns

Connection #nn (Protocol)	Date	Time	Parameter i	Parameter j	Parameter ...
---------------------------	------	------	-------------	-------------	---------------

with

- nn is the number of the connection
- Protocol is UDP or TCP,
- Date (MM/DD/YYYY)
- Time (HH:MM:SS.mmm) **UTC time**
- Parameter i, Parameter j ... are the statistics chosen by the user (up to 13 parameters can be selected)
Example: Parameter i = Tx (Transmit) Throughput, Parameter j = Tx (Transmit) Packets

Next lines: numerical values

Connection #nn (Protocol)	MM/DD/YYYY	HH:MM:SS.mmm	nnn.nn	nnn.nn	...
---------------------------	------------	--------------	--------	--------	-----

Additional marks for TCP, UDP and SCTP connection events

Connection #nn (TCP or UDP or SCTP) START: This indicates for the connection #nn (nn: from 01 to 16):

- UDP connection: ready to receive traffic.

- TCP connection: beginning of receiving traffic

Numerical values are latest values computed by **LanTraffic V2** for the line.

Connection #nn (TCP or UDP or SCTP) END: This indicates the end of traffic for the connection #nn. Numerical values are latest values computed by **LanTraffic V2** for the line.

Additional mark for TCP, UDP or SCTP disconnection events

Connection #nn (TCP or UDP or SCTP) ERROR: This mark indicates the reason of the disconnection if this one is not produced by the click on "Stop receiving" button or the normal shutdown of the traffic generation (due to the remote generator parameters, for example: Number packets to send = 1000). When this mark is included in the Receiver traces, numerical values are replaced by the error message returned by **LanTraffic V2**.

Idle connections

When the connection is idle, numerical values are set to 0 for “Tx Throughput” and “Rx Throughput”.

“Tx Volume”, “Rx Volume” and “Data Not Echoed” columns are zeroes if the selected protocol is TCP. The UDP connection remains active until the Receiver is stopped: latest values remains displayed and exported too.

Conventions

“Volume to send” and “Remaining Volume” are filled with the “N/A” symbol when the generator is not configured with “File to send”. “Seq. Num. Errors” and “Jitter” are filled with the “N/A” symbol until one “RTT” header is found in the received data by the Receiver part.

“Tx Packets”, “Rx Packets”, “Tx Pkts Throughput” and “Rx Pkts Throughput” are filled with the “N/A” symbol when the protocol used for the concerned connection is not UDP.

When a connection is using SCTP protocol, some statistics are filled with the “N/A” symbol: “Data Not Echoed”, “Volume to Send”, “Remaining Volume”, “Tx Packets”, “Tx Volume”, “Jitter”, “Tx Pkts Throughput” and “Tx Throughput”.

10.5.6.2 Export Receiver file sample

In the following example, 3 connections (#01, #02 and #03) have been selected for the local Receiver with 5 parameters exported: Rx (Receive) Throughput, Rx (Receive) Pkts (Packets) Throughput, Rx (Receive) Packets, Jitter and Seq. Num. Errors (Sequence Numbering errors):

- Connection #01: Protocol = TCP & Working Mode = Absorber
- Connection #02: Protocol = TCP & Working Mode = Absorber
- Connection #03: Protocol = UDP & Working Mode = Absorber

The remote Sender has been configured with 3 connections:

- Connection #01: Protocol = UDP & Traffic Generator type = Packets generator [Size Packet = 1460, Inter Packet Delay = 20, RTT option = No, Packets Number = 1000]
- Connection #02: Protocol = TCP & Traffic Generator type = Packets generator [Size Packet = 1460, Inter Packet Delay = 20, RTT option = Yes, Packets Number = 1000]
- Connection #03: Protocol = TCP & Traffic Generator type = Packets generator [Size Packet = 1460, Inter Packet Delay = 20, RTT option = Yes, Packets Number = 1000]

Parameters set in the General Parameters of the Configuration menu:

- Refresh time = 2 seconds
- Throughput sampling period = 5 seconds
- Unit = kilobytes (kB) & kilobits per second (kb/s)

First the local Receiver is started and then the 3 connections of the remote Sender are started all together. Then the connections #01, #02 and #03 of the remote Sender are stopped manually.

Starting session 12/26/2007 at 16:26:10.500 (UTC Time)

LanTrafficV2 Receiver

Connection #i (Protocol)	Date	Time	Rx Throughput (kb/s)	Rx Pkts Throughput (Pkts/s)	Rx Packets (Pkts)	Jitter (ms)	Seq. Num. Errors

10.6 The Throughput Graphics tab

This fourth tab allows the display of the throughputs for the Receiver and Sender parts, and the configuration of the graphics display,

This tab is divided in three areas:

- the '**Graphic area**' where curves are displayed (up to 16 curves simultaneously),
- the '**Graphical Display**' object to select curves to display,
- and the '**Display configuration**' object to change the scale parameter.

This snapshot shows 6 curves for connections #01 up to #06 for the Tx (Transmit) part of the Sender.

10.6.1 The Graphical Display object

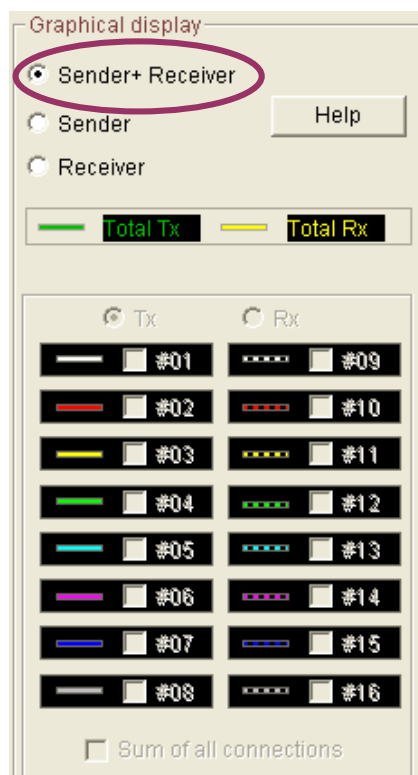

This object allows selecting curves to display with three choices:

- Sender + Receiver: 16 connections for the Sender + 16 connections for the Receiver
- Sender
- Receiver

The 'Reset Display' button allows clearing the graphic display.

When you select 'Sender + Receiver', two curves are displayed:

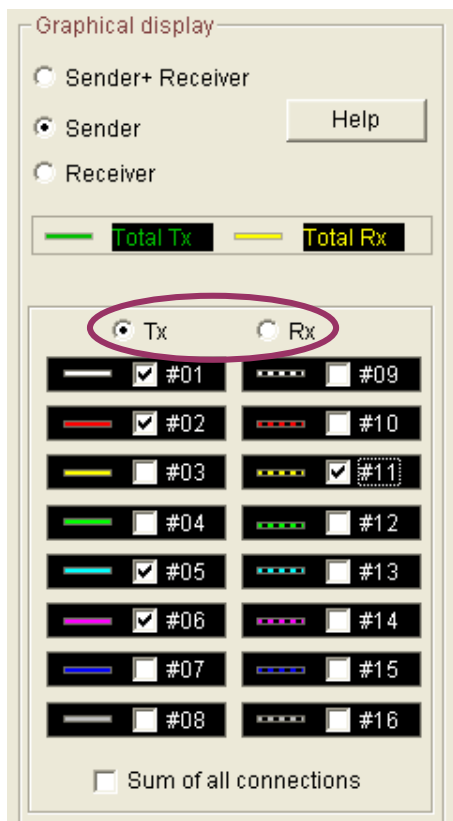

Total Tx (green curve) represents 'Total **LanTraffic V2** sending throughput' = total sending throughput of the Sender + total echoing throughput of the Receiver.

Total RX (yellow curve) represents 'Total **LanTraffic V2** receiving throughput' = total receiving throughput of the Sender + total receiving throughput of the Receiver.

If the total **LanTraffic V2** sending throughput and the total **LanTraffic V2** receiving throughput are equal, only the green line is visible. If the throughput is superior to the values represented in the graph scale, a red line informs the user.

When you select 'Sender' or 'Receiver', a choice is offered: 'Tx' (Transmit) or 'Rx' (Receive) as shown below:

For example, the user has selected 'Tx' for the Sender part.

One or more connections can be selected (via the #i check box) and a colored curve is displayed for each selected connection. Up to 16 connections can be displayed on the graphic.

The check box 'Sum of all connections' allows displaying a curve that is the throughput sum of all connections (in the example above, sum of all Transmit throughputs for the sender part).

So, you can see on the graph:

- ▶ for the **Sender** part:
 - ⇒ Transmit (Tx):
 - 1 curve for each connection (up to 16 curves)
 - 1 curve for the sum of all connections
 - ⇒ Receive (Rx):
 - 1 curve for each connection (up to 16 curves)
 - 1 curve for the sum of all connections
- ▶ for the **Receiver** part:
 - ⇒ Transmit (Tx):
 - 1 curve for each connection (up to 16 curves)
 - 1 curve for the sum of all connections
 - ⇒ Receive (Rx):
 - 1 curve for each connection (up to 16 curves)
 - 1 curve for the sum of all connections

10.6.2 The Display Configuration object

Display Configuration

Refresh time for the graphic display (1 to 60 seconds)

Physical Link Throughput

☐ 10 Mb/s ☒ User-defined scale:

Minimum Value (from 0 to 999,999 kb/s):

Maximum Value (from 1 to 1,000,000 kb/s):

Refresh time defines the time represented by one pixel on the graph. With value = 1, a new point is drawn every second. In this case, the graph shows an approximately 3-mn period.

Notice that **LanTraffic V2** offers up to 3 hours historic: set Refresh time for graphic display to 60.

You can configure the **Physical Link Throughput**: used as scale of the throughput graph: 10 Mb/s, 100 Mb/s, 1 Gb/s or any user-defined scale (limited to 1,000,000 in kb/s or to 1,048,576 Kib/s).

Part 11 Command Line Parameters

LanTraffic V2 can be started by using a command line with parameters.

11.1 General rule

Parameters should be separated by a space. **LanTraffic V2** is not case sensitive.

11.2 Commands available to start LanTrafficV2

The commands below are only available for the first command line i.e. when no LanTrafficV2 instance is running.

11.2.1 Context filename

The context filename is a set of parameters for **LanTraffic V2**. This set can be saved in a file and reloaded later in such a way the user doesn't have to re-enter any addresses and configuration parameters.

Command line parameter to define and load this context: **CONTEXT**

Syntax: **CONTEXT:filename**

Where filename may be `c:\temp\file.ctx` or `"c:\Program Files\LanTrafficV2\file.ctx"`.

The `"` symbol is necessary to use spaces in filenames or directories.

11.2.2 Starting the "LanTraffic V2" Receiver part

There is only one command parameter to start the Receiver part.

Syntax: **-R**

11.2.3 Starting the "LanTraffic V2" Sender part

The Sender part can be operated following 2 modes: 'Unitary testing mode' and 'Automatic testing mode'.

Syntax for the 'Automatic testing mode': **-SAutomatic**

Syntax for the 'Unitary testing mode': **-SOption**

Where **Option** may be:

- All: all connections defined are started. To start, a connection should have the IP address defined.
- 01..16: only the connection defined is started.

11.3 Commands available when LanTrafficV2 is started

The commands below are available when a **LanTrafficV2** instance is running.

11.3.1 Stopping the "LanTraffic V2" Sender and Receiver parts

There is only one command parameter to stop the Sender and the Receiver.

Syntax: **-STOP**

11.3.2 Unload the "LanTraffic V2" application

This command parameter allows unloading the **LanTraffic V2** instance.

Syntax: **-UNLOAD**

11.4 Command line samples

- **LanTrafficV2 -R**

This command line starts **LanTraffic V2** with default parameters and starts the Receiver part.

- **LanTrafficV2 CONTEXT:c:\temp\f20030607.ctx -SAutomatic**

This command line launches **LanTraffic V2** and loads the file context "c:\temp\f20030607.ctx."

Then the Sender is started in the 'Automatic testing mode' (for defined connections).

- **LanTrafficV2 CONTEXT:c:\temp\f20030607.ctx -SAll**

This command line starts **LanTraffic V2** and loads the file context named c:\temp\f20030607.ctx .

Then the Sender is started in the 'Unitary testing mode' for every connection defined.

- **LanTrafficV2 CONTEXT:c:\temp\f20030607.ctx -R -S01 -S02 -S04 -S16 -S12**

This command line starts **LanTraffic V2** and loads the file context named c:\temp\f20030607.ctx .

Then the receiver is started, and for the Sender connections #01, #02, #04, #12, #16 are started in the 'Unitary testing mode' (if they are defined).

11.5 Error return code

LanTraffic V2 does not return an error code if a syntax error is found in parameters or if an unknown parameter is used.

Part 12How To ...

This part presents simple but real examples of some **LanTraffic V2** usages. Each sample is detailed to help you to reproduce it.

The list is not exhaustive. You may find specific usage of **LanTraffic V2** on your own as it may apply to various network configurations.

12.1 ... Check a router configuration

With this sample, it is shown how to check if a router is able to handle the DSCP value in the IP header (see 10.4.1.3.2.4 The DSCP field (with IPv4 only)).

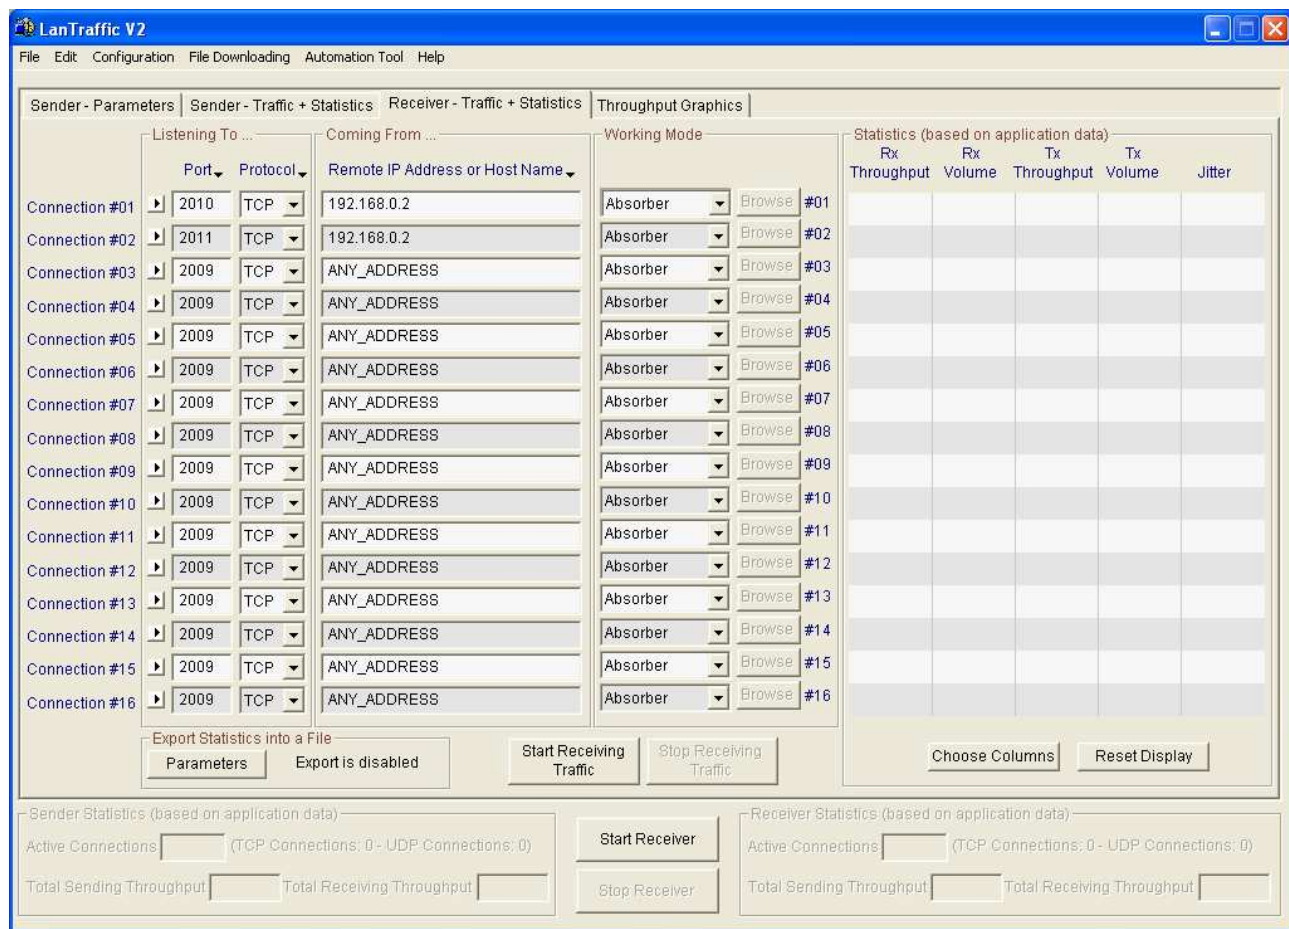

PC #1 is the Sender and PC #2 is the Receiver.

12.1.1 PC #2 parameters

After launching **LanTraffic V2** on PC #2, select the "Receiver – Traffic + Statistics" tab to enter parameters for connections #01 and #02:

- 2 different values as port numbers: connection #01 get 2010 and connection #02 get 2011.
- Both connections are configured with the TCP protocol.
- You may also enter the PC #1 IP address as source IP address, for each connection but it is not mandatory in that case due to the TCP protocol selection.
- The Receiver mode is 'Absorber'.

The screenshot below shows the configuration at this point.

To start the Receiver, click on the 'Start Receiving Traffic' button.

12.1.2 PC #1 parameters

PC #1 acts as the Sender.

Launch **LanTraffic V2**; the default tab is "Sender – Parameters".

To configure connection #01 and connection #02, proceed as following:

- Enter the PC #2 IP address for connection #01 and connection #02.
- Set the port number of connection #01 to 2010.
- Set the port number of connection #02 to 2011.
- Select TCP as protocol for both connections.
- Click the "Parameters #01" button to choose the traffic mode and to configure it for connection #01. The selection should include:
Traffic generator type = Packets generator,
Number of packets = 0 (unlimited),
Packet size = 1460
Inter-packet delay = 20 ms,
DSCP = 14.

LanTraffic V2 - Traffic Generator Parameters for the Unitary Mode (connection #01)

Step1: Select the traffic generator type
First select the traffic generator which is going to be used on this connection.

☒ Packets Generator

Packets number (0 to 99,999,999) (0 = infinite value)

Packet Contents (00 to FF hexa byte)

☒ Fixed

☐ Randomized min max

☐ Alternated value-1 value-2

☐ Increasing / Decreasing min max step

☐ Mathematical Law

Law: Data volume to send

Edit...

Uniform Law
Range: 10.0 kB to 2.50 MB

☐ File to send

Filename: Browse

Loop counter (1 to 99) Idle time between each loop (0 to 99 s)

Step2: Specify data size and packets parameters
In this step, define data size and packets parameters as well as the delay between each sent packet or specify values for some IP header fields.

TCP Data Size (1 to 65535 bytes)

☒ Fixed

☐ Randomized min max

☐ Alternated size-1 size-2

☐ Increasing / Decreasing min max step

Inter Packet Delay (0 to 9,999 ms)

☒ Fixed (See FOREWARNINGS menu please)

☐ Randomized min max

☐ Alternated value-1 value-2

☐ Increasing / Decreasing min max step

☐ Mathematical Law

Edit...

RTT Option ☐ Yes ☒ No

DSCP (1 hexa byte) Value (0x00 to 0x3F)

Time To Live (TTL) Value

Step 3 (Optional): Enable a throughput limit
When one of these two options is selected, LanTraffic V2 generates the traffic with best effort to respect the throughput chosen.

Mean Throughput (8 to 999,999 kb/s)

☐ Use value

☒ Inter Packet Delay adjusted by LanTraffic V2 automatically.

☒ TCP or UDP Data Size adjusted by LanTraffic V2 automatically.

Mean Throughput (1 to 99,999 Pkts/s)

☐ Use value (except for TCP connection)

OK Cancel Help

- The same parameters are set for connection #02 but the DSCP value is changed to 0.

To start the Sender, select the "Sender – Traffic + Statistics" tab and press 'Start #01' and 'Start #02'.

12.1.3 What should happen?

If your router under test is configured to take into account the DSCP field, the connection #01 should be faster than the connection #02 because the connection #01 has requested the maximum throughput to the router via the DSCP field.

12.2 ... Check a firewall configuration

LanTraffic V2 may be used to check the firewall configuration. The ability for a user to specify the port number connection per connection is used in this test.

Suppose that a server handles a web site and is linked to Internet via a fixed IP address. This server is also an Internet gateway and it includes a company database. This is why a firewall has been installed. The objective of this test is to check if the firewall access restriction is correct. The remote access will use a modem link as shown in the following figure:

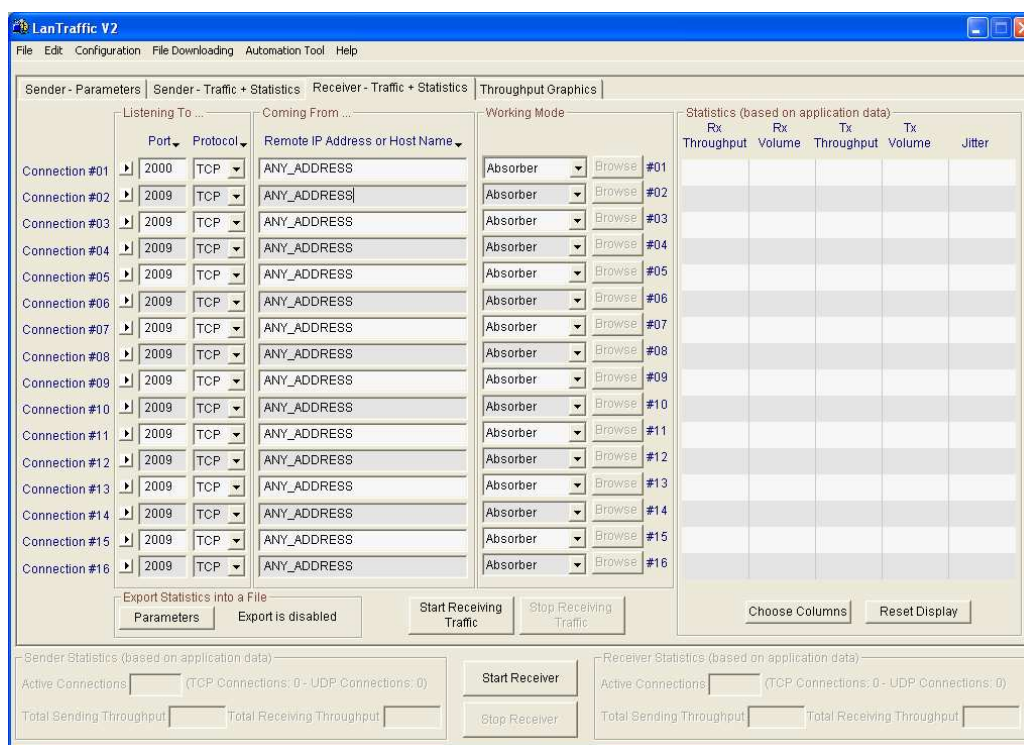

12.2.1 LanTraffic V2 parameters on the server

To check that the ports are not remotely available on the server, we start **LanTraffic V2** and configure the "Receiver – Traffic + Statistics" tab.

If a connection can be established, the connection has been able to go through the firewall. This is what is NOT expected: the firewall should be reconfigured.

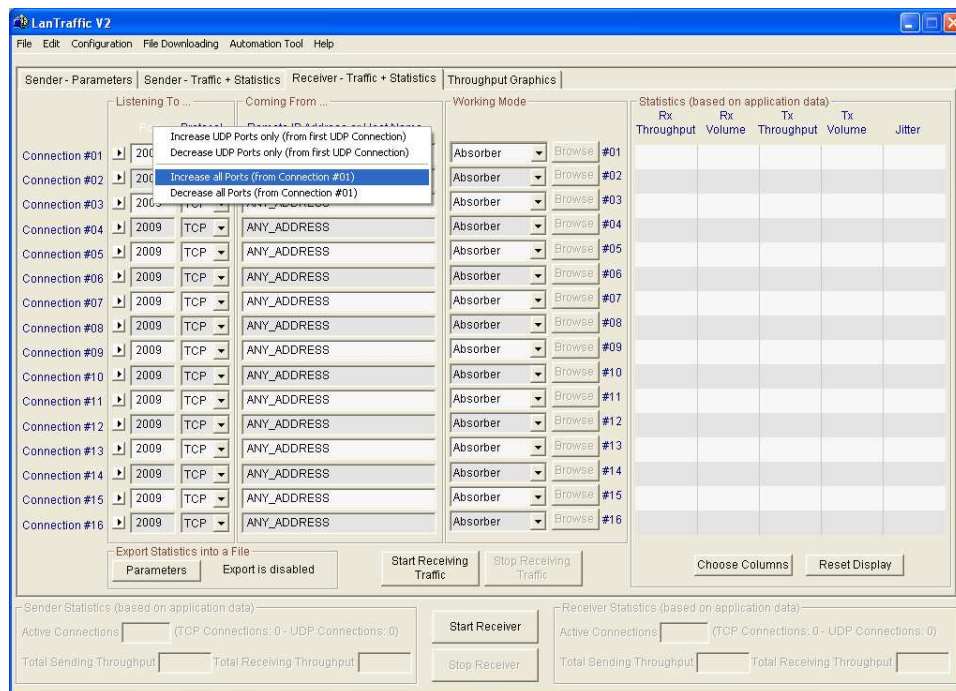

In this example we check the TCP connections port from 2000 to 2015. You can adapt this range and the protocol to your specific environment.

Let's start with the connection #1.

To access incoming TCP connection coming from any Sender, the IP address 'ANY_ADDRESS' has been selected. The port number is 2000 and the protocol is configured with TCP.

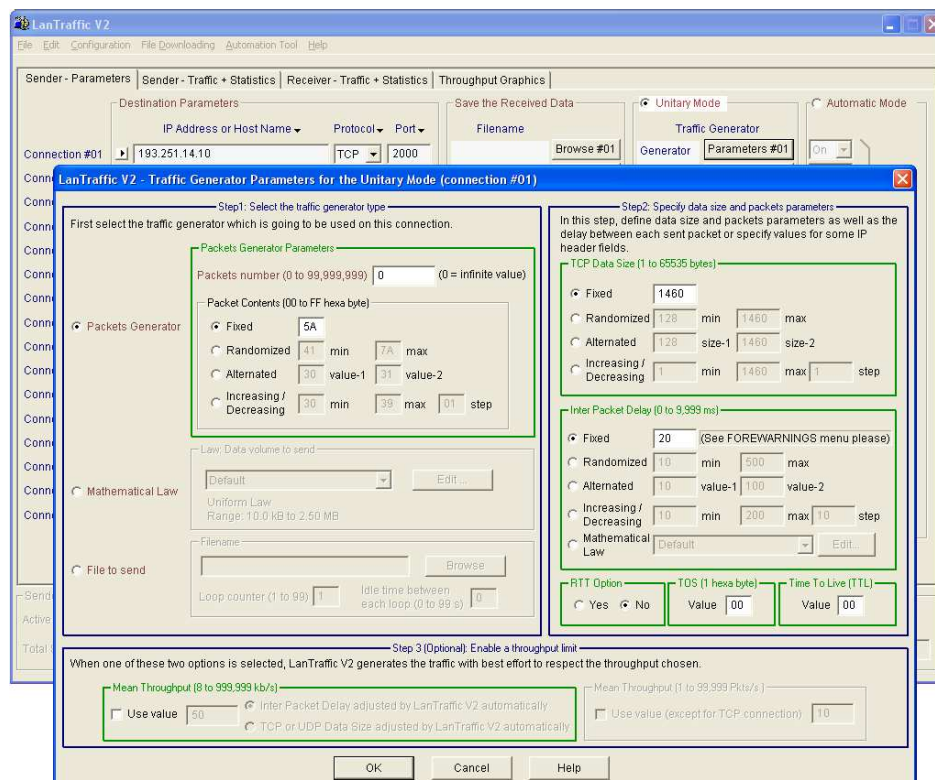

To easily increase the port number for each connection, you can use the 'Port floating menu' as shown below:

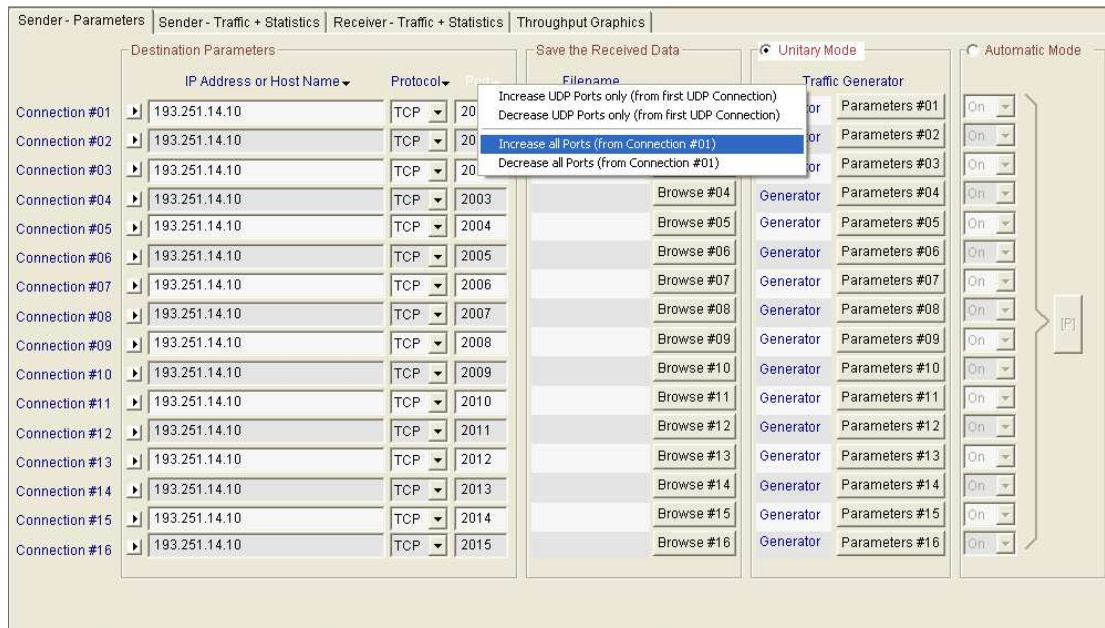

You are ready to start the Server by pressing the 'Start Receiving Traffic' button.

12.2.2 LanTraffic V2 parameters for the Remote PC

To change parameters of the connection #01, select the "Sender-Parameters" tab.

If the server IP address is 193.251.14.10, you enter this IP address, select the TCP protocol and enter 2000 as port number. To change the traffic generator click on the 'Parameters # 01' button. To apply these changes for all connections, you can use the copy / paste mechanism. When the 16 connections are the same, use the 'Port floating menu' to increase the port number as shown below:

Then select the "Sender – Traffic + Statistics" tab to start connections by clicking the 'Start All Connections' button.

12.2.3 What result can you expect?

There should be no connection established if the firewall is configured to disable ports 2000-2015 for TCP connections. In that case, an error message is displayed in the Statistics area for each connection: 'Connection failed: no response from the Remote'.

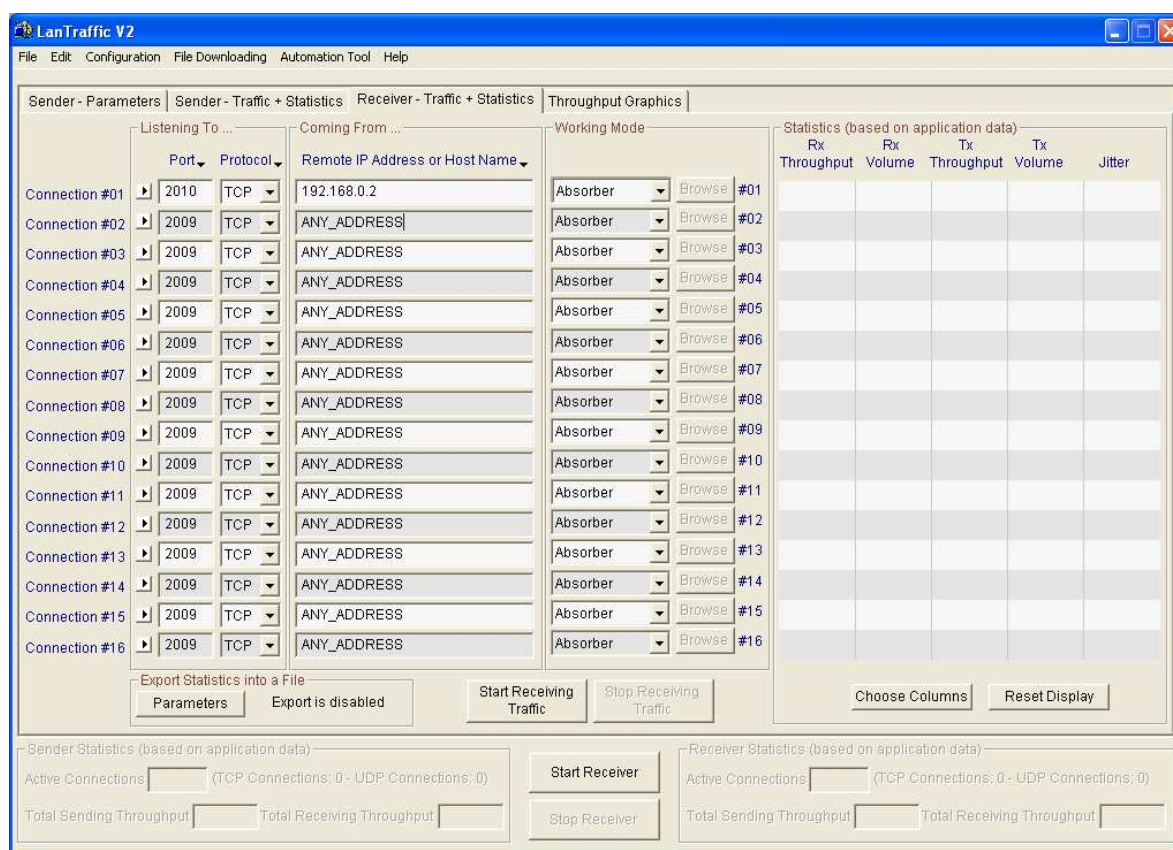

12.3 ... Reach the best throughput

To check the throughput between two PCs, you should use a crossed-cable as shown in the next figure. This test supposes the use of IPv4.

12.3.1 PC #2 parameters

Start **LanTraffic V2** on PC #2 and select the "Receiver – Traffic + Statistics" tab.

Assuming the connection #01 will be used, enter the IP address of PC #1 (192.168.0.2) or ANY_ADDRESS, the port number here is arbitrary selected to 2010. Select the TCP protocol and the working mode to 'Echoer'. The echoer mode is useful to check full-duplex speed transfer.

Start the Receiver by pressing the 'Start Receiving Traffic' button.

12.3.2 PC #1 parameters

Start **LanTraffic V2** on PC #1 and select the "Sender – Parameters" tab.

The connection #01 will be used in this example. Enter the IP address of PC #2 (192.168.0.23), select the TCP protocol and enter the port number 2010 (same as PC #2). To change the traffic generator click on the 'Parameters #01' button.

Select the unlimited packet number with 0 in the packet number field; the packet size is the best with 1460 bytes long. The inter-packet delay should be 0 for the maximum throughput.

Then select the "Sender – Traffic + Statistics" tab and click on the 'Start #01' button.

Columns 'Throughput' for the PC #2 Sender and PC #1 Receiver will show throughputs. Best throughput depends mainly on the CPU, the memory and the NIC quality. If the PCs you are using are different, **choose the most powerful PC as Receiver**.

12.4 ... Do an ADSL connection simulation

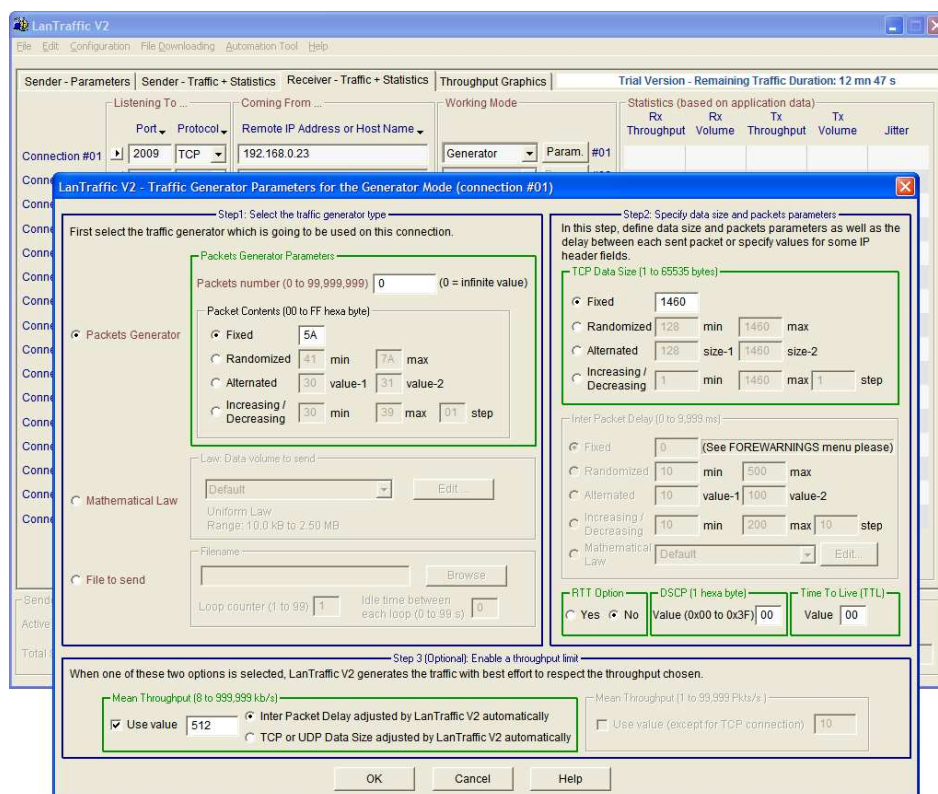

LanTraffic V2 can be used to simulate an ADSL connection, which is asymmetrical by nature. The next figure is one of those that can be used. Hub or router may also be used to connect the 2 PCs.

Assumption: PC #2 is the user PC and PC #1 is the server. The PC #1 to PC #2 connection link speed is 128 kbps and the reverse link speed is 512 kbps with IPv4.

12.4.1 PC #2 parameters

Start **LanTraffic V2** on PC #2 (server) and select the "Receiver – Traffic + Statistics" tab. The connection #01 will be used.

The IP address may be PC #1 (192.168.0.2) or any IP address (ANY_ADDRESS). Assuming you have selected the port number as 2010 and the TCP protocol, then select the receiving working mode 'Generator'. The button 'Param.' is enabled to change the generator parameters.

Just select the unlimited number of packets (Packets number = 0) and the packet size to 1460. The throughput is limited to 512kbps: check the 'Use value' box in the 'Mean Throughput' group box and enter 512 in the edit field.

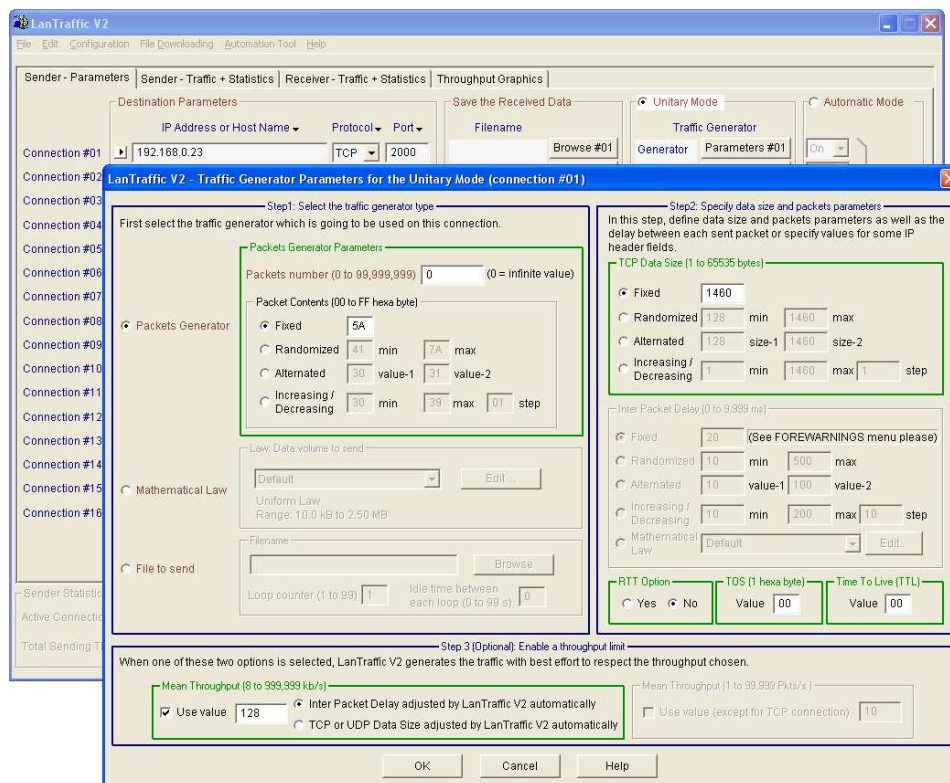

To start the Receiver, push the 'Start Receiving Traffic' button.
To establish the connection go to the PC #1.

The traffic will start when the connection will be established with the PC#1. Because PC #2 is in receiving mode, it can't establish the connection by itself: it should wait for PC #1 to establish the connection before being able to transfer data.

12.4.2 PC #1 parameters

Start **LanTraffic V2** on PC #1 and select the "Sender – Parameters" tab.

The connection #01 will be used in this example. Enter the IP address of PC #2 (192.168.0.23), select the TCP protocol and enter the port number 2010 (same as PC #2). To change the traffic generator, click on the 'Parameters #01' button. Select the unlimited packet number with 0 in the packet number field; the packet size is 1460 bytes. The throughput is limited to 128 kbps: check the 'Use value' box in the 'Mean Throughput' group box and enter 128 in the edit field.

Then select the "Sender – Traffic + Statistics" tab and click on the 'Start #01' button.

12.5 ... Generate multicast IP traffic

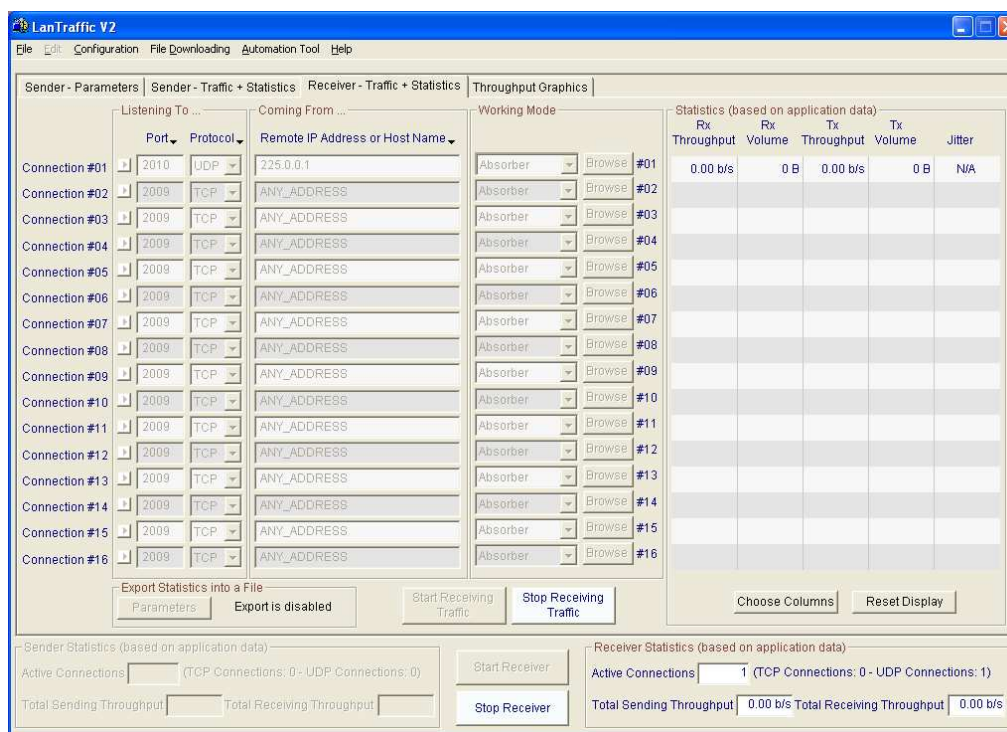

The next figure shows how to generate IPv4 multicast traffic.

Multicast traffic is based on the UDP protocol. Its characteristic is that multiple receivers can get data from one source – or sender – just indicating from which source they would like to receive data.

12.5.1 PC #2 and PC #3 parameters

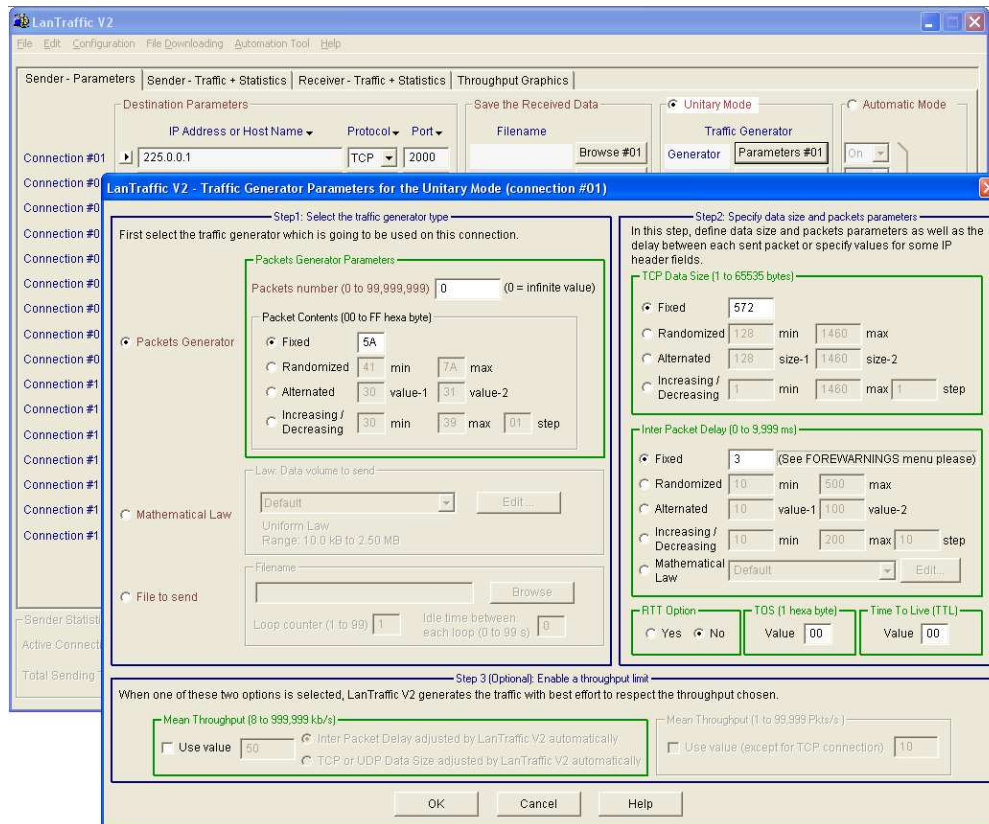

Let us assume that PC #2 and PC #3 are set in the Receiver mode, whereas PC #1 is the Sender (server). Start **LanTraffic V2** on PC #2 and select the "Receiver – Traffic + Statistics" tab.

Just select the IP multicast address 225.0.0.1, port number (2010) and UDP as protocol. The Receiver mode should be 'Absorber' because multicast traffic is unidirectional by nature. To start Receivers, click the 'Start Receiving Traffic' button on both PCs.

12.5.2 PC #1 parameters

PC #1 is used as the Sender. Start **LanTraffic V2** and select the "Sender – Parameters" tab.

Assuming the connection #01 is selected, then enter the IP address '225.0.0.1'. Then select the port number as PC #2 and PC #3 (2010) and the UDP protocol. Press the 'Parameters #01' button to set traffic generator parameters. Enter the packet number, the packet size and the inter-packet delay: 2 in this example.

To start the Sender, select the 'Sender – Traffic + Statistics' tab and press the 'Start #01' button.

If the hub does not filter multicast traffic and if your NICs accept the multicast address selection, PC #2 and PC #3 should receive the same number of packets (the number sent by PC #1).

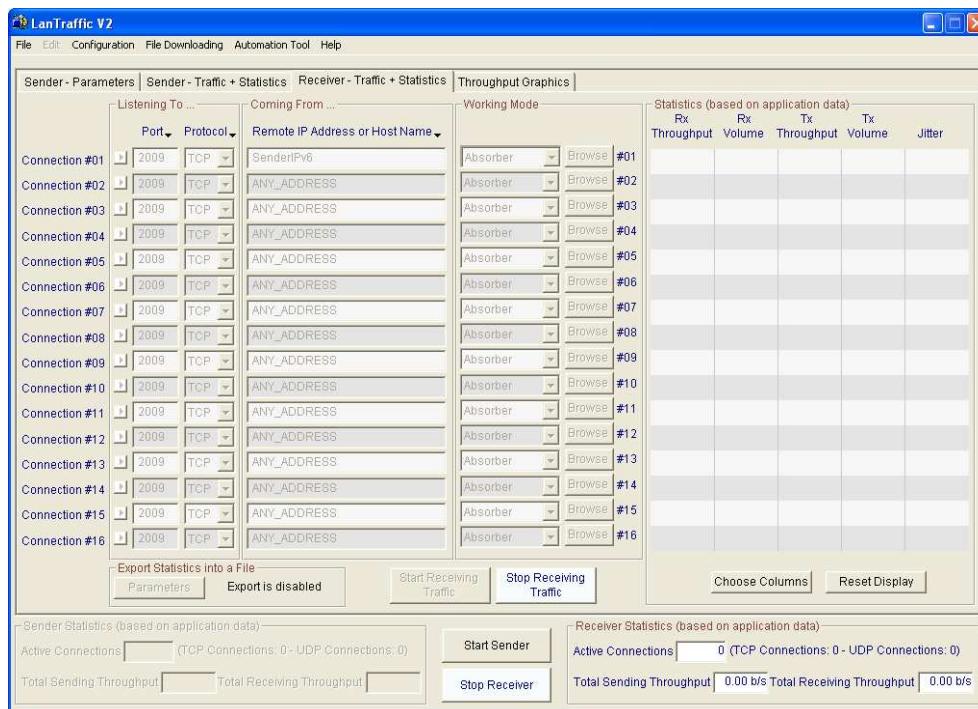

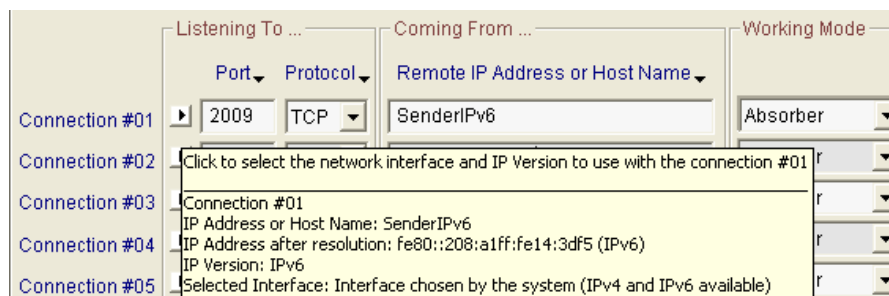

12.6 ... Generate an IPV6 connection

To check the IPv6 throughput between two PCs, you may use a crossed-cable or a switch as shown below.

12.6.1 PC #2 parameters

Start "LanTrafficV2" on PC #2 and select the "Receiver - Traffic + Statistics" tab. Enter the canonical name of the IPv6 sender. You may check parameters using the black arrow tooltip by moving the mouse over the arrow of the connection #01.

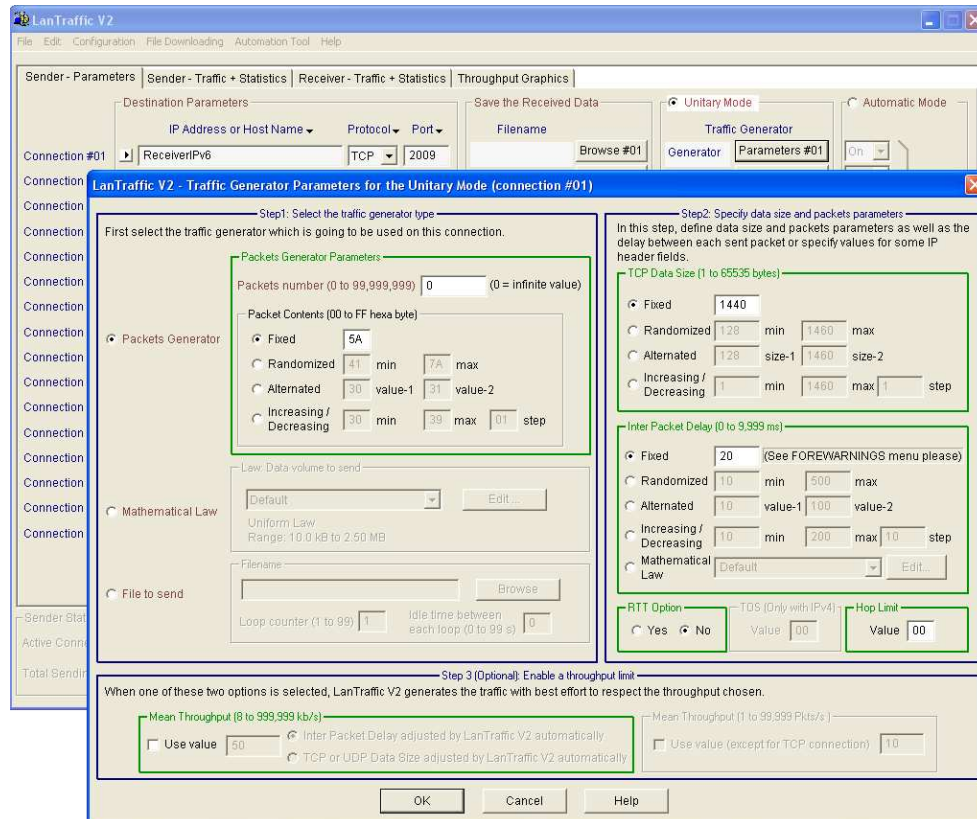

Assuming the connection #01 will be used, the port number here is arbitrary selected to 2009. Select the TCP protocol and the receiving working mode to 'Absorber'. Start the Receiver by pressing the 'Start Receiving Traffic' button.

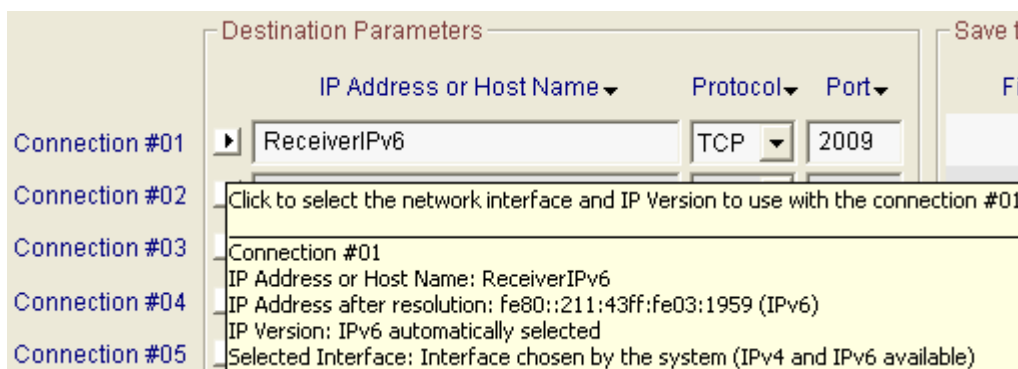

12.6.2 PC #1 parameters

Start **LanTraffic V2** on PC #1 and select the "Sender – Parameters" tab.

The connection #01 will be used in this example. Enter a canonical IPv6 address for PC #2, select the TCP protocol and enter the port number 2009 (same as PC #2). To change the traffic generator, click on the 'Parameters #01' button.

Select the unlimited packet number with 0 in the packet number field; the packet size is the best with 1440 bytes long. The inter-packet delay should be 0 for the maximum throughput. The summary tooltip may be used to check the IP version parameters.

Then select the "Sender – Traffic + Statistics" tab and click on the 'Start #01' button.

The throughput columns for the PC #2 Sender and PC #1 Receiver will show the throughputs. Best throughput depends mainly on the CPU, the memory and the NIC quality.

If the PCs you are using are different, **choose the most powerful PC as the Receiver.**

Part 13 Source/Local IP Address and Interface requirements

With **LanTraffic V2** version 2.7, the interface selection is required to carry out IPv6 unicast exchanges only.

“LanTraffic V2” acting as:	Sender (UDP, TCP and ICMP)		Receiver (UDP and TCP)	
	IPv4	IPv6	IPv4	IPv6
Unicast exchange	<i>Interface selection is not required</i>	<i>Interface selection is required</i>	<i>Interface selection is not required</i>	<i>Interface selection is not required</i>
Multicast exchange	<i>Interface selection is not required</i>	<i>Interface selection is not required</i>	<i>Interface selection is not required</i>	<i>Interface selection is not required</i>

Consequences when an Interface is selected

For the **LanTraffic V2 Sender**, the selection of an Interface implies that a source address is fixed with the following consequences:

1. Every sent packet gets the Source IP address selected as source IP address, whatever the destination is.
2. Destination addresses should match the network mask and scope associated to the selected source IP address.
3. Be careful: even if the resolution carried out by the operating system on your destination address or host name is right, the connection may not be able to generate data. (Example: bad selected interface, wrong entries into the Host file...)

Examples:

- The source IP Address is 192.168.0.23 with 255.255.255.0 as network mask and no gateway.
The matching destination IP Addresses are: 192.168.0.X with X between 1 and 255.
- The source IP Address is 192.168.0.23 with 255.255.255.0 as network mask and no gateway.
The DNS 192.168.1.1 cannot be reached. The matching destination IP Addresses are only: 192.168.0.X with X between 1 and 255.

For the **LanTraffic V2 Receiver**, the selection of an interface implies that a local address is fixed with the following consequences:

1. With UDP protocol, the TCP/IP stack compares every packet received to the local IP address, whatever the source is. Packets matching are the only ones sent to the relevant connection of **LanTraffic V2**.
2. With TCP protocol, **LanTraffic V2** compares the SYN packet received to the local IP address, whatever the source is. If the packet is matching the connection is accepted and a room is reserved for it. Then the packets matching are the only ones sent to this relevant connection.
3. Be careful: even if the resolution is carried out by the operating system on your destination address or host name is right, the connection may not be able to receive data (example: bad selected interface, wrong entries into the Host file...).

Examples:

- The local IP Address is 192.168.0.23. The packets destination IP address matching is: 192.168.0.23.
- The local IP Address is 192.168.0.23. The packets with a destination IP address equal to 192.168.0.30 cannot reach this connection.

Part 14Appendix

14.1 Mathematical laws used by LanTraffic V2

LanTraffic V2 is based on the use of mathematical laws to generate values used:

- In the Unitary Mode for the Traffic Generator:
 - to specify the traffic generator (and data volume to send on the connection) if the option 'Mathematical Law' is selected as data source (four available laws: Uniform, Exponential, Pareto, Gauss)
 - to specify the inter-packet delay if the option 'Mathematical Law' is selected (four available laws: Uniform, Exponential, Pareto, Gauss)
- In the Automatic Mode for the Traffic Generator:
 - to specify the starting time of the connections (two available laws: Uniform, Exponential)
 - to specify the data volume to send for each connection (four available laws: Uniform, Exponential, Pareto, Gauss)

Hereafter is a detailed presentation of each mathematical law.

14.1.1 Uniform law

Distribution of Uniform Law is:

$$f(x) = \frac{1}{Beta - Alpha} \quad \text{for } Alpha < x < Beta$$

$$f(x) = 0 \quad \text{for } x < Alpha \text{ or } x > Beta$$

where *Alpha* is the inferior parameter and *Beta* the superior one.

Values between *Alpha* and *Beta* have the same probability to be drawn = $1 / (Beta - Alpha)$.

When this law is used, the unit is the millisecond for the starting time of a connection or byte for the data volume to send.

Example of values generated by LanTraffic V2 in the interval [800, 850]

Uniform Law

Density of probability for the values generated by LanTraffic V2 for

14.1.2 Exponential law

THEORY

The probability density function of the exponential law is:

$$f(x; \lambda) = \begin{cases} \lambda e^{-\lambda x} & , x \geq 0, \\ 0 & , x < 0. \end{cases}$$

where $\lambda > 0$ is the parameter of the distribution (*the rate parameter*).

The graphs above represent the theoretical density of the exponential distribution with $\lambda=0.15$ and $\lambda=0.50$.

When we use the exponential distribution to draw random numbers, most the drawn values are theoretically small and the probability to draw big numbers is smaller.

As a result of the increase of λ , the incline of the distributions curve increases. Therefore the probability to draw small numbers is bigger than the one to draw big numbers.

PRACTICE

The exponential function is implemented in *LanTraffic V2* to generate numbers following an exponential distribution.

When this law is used, the unit is the millisecond for the starting time of a connection or byte for the data volume to send.

Using this function with $\lambda=0.15$ as a parameter, we drew such numbers and then we plotted, by using a mathematical tool (*R* software), the distribution of those. Then we got the following graph.

The green curve represents the distribution of random numbers generated by R and the red one represents the distribution of those generated by *LanTraffic V2*. They are very similar.

As shown in the theoretical part, the probability to have small numbers is much bigger than the probability to have big ones.

For example, we generate 50000 numbers following the exponential law with $\lambda=0.15$. As the numbers generated by the exponential function are of type "double", we round them up to the nearest integer (e.g. 10.3 rounded up to 10 and 12.8 to 13). The histogram below summarizes the results.

The generated values are on the abscissa axe, and how many times each value is generated on the ordinate axe.

Otherwise, we can represent the same result by a curve.

In order to see the effect of the parameter λ we repeat the same operation as before with $\lambda=0.15$ and $\lambda=0.50$ and we plot both curves:

Exponential law

As the legend shows, the red curve represents the result of using the exponential law with $\lambda=0.15$ as parameter, and the green one the result of using the same law with $\lambda=0.50$.

We observe that the more the parameter λ is big, the more the maximum number generated is small and the other numbers generated are smaller too.

The table below summarizes the probability (in percent) to draw a value using the exponential function of *LanTraffic V2* with different values for λ in $\{0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1\}$.

~ generated values	λ									
	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1

95	0	0	0	0	0	0	0	0	0	0
96	0	0	0	0	0	0	0	0	0	0
97	0.002	0	0	0	0	0	0	0	0	0
98	0	0	0	0	0	0	0	0	0	0
99	0	0	0	0	0	0	0	0	0	0
100	0	0	0	0	0	0	0	0	0	0
101	0	0	0	0	0	0	0	0	0	0
102	0	0	0	0	0	0	0	0	0	0
103	0	0	0	0	0	0	0	0	0	0
104	0.002	0	0	0	0	0	0	0	0	0
105	0	0	0	0	0	0	0	0	0	0

In fact, the generated values are of type double. Here is example of values generated by the exponential law of *LanTraffic V2* with $\lambda = 0.1$:

0.227489
1.961810
1.217468
13.854097
0.474025
5.870118
2.353334
0.766254
4.868133
0.802894

To represent those values in a simple way we round up double to the nearest integer, for example:

real values	represented values
0.227489	0
1.961810	2
1.217468	1
13.854097	14
0.474025	0

5.870118	6
2.353334	2
0.766254	1
4.868133	9
0.802894	1

As a result, the values of the first column **approximately** correspond to the “x” in the theoretical representation of the exponential law.

The effect of this approximation is more important when we draw values near “0”. Thus the probability in the table to generate “0” is smaller than “1”.

Exponential law, lambda=0.15

This graph is plotted with real values generated by LanTraffic V2. We observe that the probability for $x=0$ ($=\lambda$) is bigger than for $x=1$. Here are below graphs plotted with small values for λ .

Exponential law, lambda=0.1

Maximum* drawn value = 221

Exponential law, lambda=0.01

Maximum* drawn value = 2218

Maximum* drawn value = 22180

Maximum* drawn value = 221807

**Maximum drawn value by the software, theoretically there is no maximum for the exponential law!*

14.1.3 Pareto Law

The probability density function of the Pareto Law ($a, \beta \geq 0$) is:

$$f(x) = \beta \frac{a^\beta}{x^{\beta+1}} \quad \text{if } x \geq a$$

$$f(x) = 0 \quad \text{if } x < a$$

where a is the minimum possible value and β is the parameter.

Pareto probability density functions for various Beta with $a = 1$

The horizontal axis is the x parameter. As $Beta \rightarrow \infty$ the distribution approaches $\delta(x - a)$ where δ is the Dirac delta function.

The Pareto distribution is related to the exponential distribution by: $f(x; \beta, a) = \text{Exponential}(\ln \frac{x}{a}; \beta)$

- No value generated before a .
- The more β is big the more the maximum generated value is small.
- From a the small values are more often generated than big ones.
- The cumulative frequency from a given value $m > a$ to a given value $n > a$ is the integral of $f(x)$ in this interval.

When this law is used, the unit is the millisecond for the starting time of a connection or byte for the data volume to send.

14.1.4 Laplace-Gauss law

When this law is used, the unit is the millisecond for the starting time of a connection or byte for the data volume to send.

The probability density function of the Laplace-Gauss Law is:

$$f(x) = \frac{n}{\sqrt{2\pi} \sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

where μ is the average and σ is the standard deviation..

- The more σ is small the more drawn values are near μ
- 68.27% of drawn values are in $[\mu - \sigma ; \mu + \sigma]$
- 95.45% of drawn values are in $[\mu - 2\sigma ; \mu + 2\sigma]$
- 99.73% of drawn values are in $[\mu - 3\sigma ; \mu + 3\sigma]$

μ and σ must be defined such as: $\mu > 0$ and $\mu \geq 3\sigma$ with $\sigma > 0$

14.2 LanTraffic V2 Traces

In case of problem when using **LanTraffic V2**, the trace functionality allows to retrieve in a file or in a debug window, information regarding Winsock exchanges made by **LanTraffic V2**.

Traces activation is done by modifying directly in the registry database of Windows, the value of *DEBUGLEVEL* in the key [HKEY_CURRENT_USER\SOFTWARE\ZTI\LanTrafficV2\Settings](#)

DEBUGFILENAME parameter defines the name for the file receiving traces. You must reset manually content of this file to avoid disk space wasting.

If the *DEBUGFILENAME* parameter is not selected (empty chain), traces are sent to the debug standard output -via OutputDebugString – for use with an external trace tool (e.g. DebugView from SysInternals in Microsoft, Inc or DebugMon from OSR, Inc or the Microsoft Development environment).

LanTraffic V2 application must be restarted after “DebugLevel” or “DebugFileName” parameter modification.

14.3 LanTraffic V2 configuration parameters saved in the Registry

The based key to access parameters is [\HKEY_CURRENT_USER\Software\ZTI\LanTrafficV2\Settings](#). Updated information about Registry is available in the file “Version.txt” delivered with the **LanTraffic V2** software.

The user may change the General parameters to configure **LanTraffic V2** to the local environment or to specific needs.

Parameters associated to the help should not be changed without express recommendation from ZTI Support to avoid help unusable.

14.3.1 General configuration parameters

Key name	Type	Default value	Description
<i>AutomatonDebugFilename</i>	REG_SZ	AUT_DEBUG.LOG	User defined.
<i>AutomatonDebugLevel</i>	REG_DWORD	0x0	0x00000001 Errors 0x00000100 Addition of the current time 0x00010000 Put Debug information into the file defined by <i>AutomatonDebugFileName</i>
<i>AutomatonPath</i>	REG_SZ	<i>Installation dependent</i>	Full path name to the location of the automation tool used by LanTraffic V2 .
<i>DebugFileName</i>	REG_SZ	LTV2_DEBUG.LOG	User defined
<i>DebugLevel</i>	REG_DWORD	0x0	0x00000001 Errors 0x00000002 Important information 0x00000010 Winsock return codes (partial) 0x00000020 Trace Receiver statistics (inter-packet delay in reception & time used to send when echoing) 0x00000100 Addition of the current time 0x00000200 Addition of Statistics 0x00001000 Verbose information 0x00010000 Put Debug information into the file defined by <i>DebugFileName</i>
<i>LTV2Path</i>	REG_SZ	<i>Installation dependent</i>	Full path name to the location of LanTraffic V2 used by the automation tool.

Key name	Type	Default value	Description
<i>RPCPort</i>	REG_DWORD	1002	Port number used by RPC
<i>SendTimeOut</i>	REG_DWORD	10	number of seconds for Winsock2 to send data. Required for the Echoer mode
<i>TCPConnectRetryCounter</i>	REG_DWORD	0x1	Number of retry to establish a TCP connection
<i>TCPInactivity</i>	REG_DWORD	5	TCP Inactivity tempo (seconds). The receiver stops the connection if no data is received during this time.
<i>TCPNoDelay</i>	REG_DWORD	0x0	0x0 : Nagle algorithm enabled Other value: Nagle algorithm disabled
<i>TCPReceiverPacketSize</i>	REG_DWORD	8192	Defines the packet size provided to Winsock2 WSARecv function call in bytes.
<i>UDPInactivity</i>	REG_DWORD	5	UDP Inactivity tempo (seconds). In the Receiver tab, with the Generator working mode, the connection stops when no data is received during this time.
<i>SCTPInactivity</i>	REG_DWORD	10	SCTP Inactivity tempo (seconds). The receiver or the sender stops the connection if no data is received/sent during this time.
<i>SCTPMaxChunkInQueue</i>	REG_DWORD	50	Number max of chunk that can be stored in queue.

LanTraffic V2 must be restarted after each modification of these parameters.

14.3.2 Help configuration parameters

These parameters are for information only. They must not be changed. These information are located in [\\HKEY_LOCAL_MACHINE\\Software\\ZTI\\LanTrafficV2](#)

Key name	Type	Description
ACROREADINFO	REG_SZ	Reserved
ACROREADTIMER	REG_DWORD	Reserved
HELP-AUTOMATICPARAM	REG_DWORD	Reserved
HELP-EDIT-LAWS-AUTOMATIC-STARTING	REG_DWORD	Reserved
HELP-EDIT-LAWS-AUTOMATIC-VOLUME	REG_DWORD	Reserved
HELP-EDIT-LAWS-UNITARY-VOLUME	REG_DWORD	Reserved
HELP-EXPORTSTATS-SENDER	REG_DWORD	Reserved
HELP-EXPORTSTATS-RECEIVER	REG_DWORD	Reserved
HELP-FILEDOWNLOADING	REG_DWORD	Reserved
HELP-MENU	REG_DWORD	Reserved
HELP-PARAMCNX-SENDER	REG_DWORD	Reserved
HELP-PARAMCNX-RECEIVER	REG_DWORD	Reserved
HELP-THROUGHPUT	REG_DWORD	Reserved
HELP-UNITARYPARAM	REG_DWORD	Reserved

14.3.3 Unit configuration parameter

LanTrafficV2 handles this parameter when a unit change occurs. It must not be changed.

Key name	Type	Description
UsedUnit	REG_DWORD	Reserved
UseLocalTime	REG_DWORD	Reserved

14.4 Default values of a context

The default values when opening a new context are:

- Sender - Parameters**

Interface	Interface chosen by the system		
IP version	Automatically Selected		
IP address	NO_ADDRESS		
Port Number	2009		
Protocol	TCP		
Testing mode	Unitary Mode	Data source	Packet generator (number of packets: infinite, packet contents: fix = 5A)
		Packets size	Fix = 1460 bytes
		Inter Packet Delay	Fix = 0 ms
		RTT option	No
		DSCP value	0
		TTL value	0

- Sender – Traffic + Statistics**

Columns for the statistics	Tx Throughput Tx Volume Tx Packets Rx Throughput Rx Volume Rx Packets Jitter
Clear on Stop	Unchecked
Export Statistics into a File	Export is disabled
Maximum size	10 MB

- Receiver - Traffic + Statistics**

Interface	Interface chosen by the system
IP version	Automatically Selected
IP address	ANY_ADDRESS
Port number	2009
Protocol	TCP
Working Mode	Absorber
Columns for the statistics	Rx Throughput Rx Volume Tx Throughput Tx Volume Jitter
Export Statistics into a File	Export is disabled
Maximum size	10 MB

- Throughput Graphics**

Refresh time for graphic display	2 sec
Physical Link Throughput	10 Mb/s

- **Configuration**

General Parameters	
Refresh time	2 sec
Throughput sampling period	5 sec
Timeout for TCP packets echoed	500 ms
Timeout for UDP packets echoed	700 ms
LanTraffic V2 Buffer size	
Receive buffer size	65535
Transmit buffer size	65535

AutoComplete...	Enable
------------------------	--------

- **File transfer**

Port number	2500
--------------------	------

- **Sender and Receiver statistics file**

Maximum size	10 MB
---------------------	-------

- **Data volume mathematical laws**

Name	Type	Parameters	Range
Default	Uniform	Alpha = 10,000 Beta = 2,500,000	[9.77 KB, 2.38 MB]
Small Volume	Uniform	Alpha = 5,000,000 Beta = 10,000,000	[4.77 KB, 9.54 MB]
High Volume	Uniform	Alpha = 110,000,000 Beta = 1,050,000,000	[105 MB, 0.98 GB]
Variable	Uniform	Alpha = 11,000,000 Beta = 950,000,000,000	[10.5 MB, 885 GB]

- **Inter Packet Delay mathematical laws**

Name	Type	Parameters	Range
Default	Uniform	Alpha = 0 Beta = 5	[0 ms, 5 ms]
Close delay law	Uniform	Alpha = 10 Beta = 20	[10 ms, 20 ms]
Far off delay law	Uniform	Alpha = 500 Beta = 1000	[500 ms, 1 s]
Variable delay law	Uniform	Alpha = 1 Beta = 1000	[1 ms, 1 s]

- **Starting time mathematical laws**

Name	Type	Parameters	Range
Default	Uniform	Alpha = 20 Beta = 50	[20 ms, 50 ms]
Close connection law	Uniform	Alpha = 100 Beta = 200	[100 ms, 200 ms]
Far off connection law	Uniform	Alpha = 10,000 Beta = 20,000	[10 s, 20 s]
Variable connection law	Uniform	Alpha = 1 Beta = 100,000	[1 ms, 1 mn 40s]

14.5 LanTraffic V2 features versus OS, protocols and IP versions.

The array below shows the LanTraffic V2 features based on the Windows versions, on the protocols and on the IP versions. The cross in a cell indicates when the feature is available.

Protocol / IP Version	TCP		UDP		ICMP		SCTP	
	IPv4	IPv6	IPv4	IPv6	IPv4	IPv6	IPv4	IPv6
OS Versions								
Windows XP	x	x	x	x	x	x	x	
Windows Server 2003	x	x	x	x	x	x	x	
Windows Vista	x	x	x	x	x	x	x	
Windows Server 2008	x	x	x	x	x	x	x	
Windows Seven	x	x	x	x	x	x	x	
Sender Part								
Unitary Mode	x	x	x	x	x	x	x	
Automatic Mode	x	x	x	x				
Interface Selection	x	x	x	x	x	x		
Receiver Part								
Absorber Mode	x	x	x	x			x	
Absorber File Mode	x	x	x	x			x	
Echoer Mode	x	x	x	x				
Echoer File Mode	x	x	x	x				
Absorber Generator	x	x	x	x				
Interface Selection	x	x	x	x				
Traffic Generator Parameters (used by the Unitary Mode and the Absorber Generator Mode)								
Max Data Size (in bytes)	65535	65535	65507	65507	65535	65535	65535	
TTL / Hop Limit	x	x	x	x	x	x		
DSCP	x		x		x (only XP)		x (only XP)	
Mean Throughput (Pkts/s)			x	x	x	x	x	
Mean Throughput (kbr/s)	x	x	x	x			x	
RTT	x	x	x	x			x
